### The weekly bulletin :Issued: 2017 Jan 30 1406 UTC :Product: documentation at http://www.sidc.be/products/bul **STCE Newsletter** 23 Jan 2017 - 29 Jan 2017 WEEK 839 from 2017 Jan 23 SOLAR ACTIVITY SUBA ACHIVITY Solar activity was very low to low, with a single C-class flare produced by spotless active region NOAA 2627 near the west limb on 28 January (C2 flare peaking at ZLIOSUT. A new region, NOAA 2659, developed quickly on 24 January and was responsible for most of the B-class flaring on 24-26 January. The other regions were observed in available coronagraphic imagery. The greater than 10MeV proton fluw was at nominal levels. A small positive equatorial coronal hole (CR) started its transit of the central meridian (CM) by the end of the period. GEOMANNETIC ACTIVITY Published by the STCE - this issue : 3 Feb 2017. Available online at http://www.stce.be/newsletter/ . The Solar-Terestrial Centre of Excellence (STCE) is a collaborative network of the Belgian Institute for Space Aeronomy, the Royal Observatory of Belgium and the Royal Meteorological Institute of Belgium. Submeasure Animits Solar wind conditions near Earth were determined by the high speed stream (HSS) from the small positive coronal hole (CH). The co-rotating interaction region (CIR) that preceded it, drove a small shock on 26 January at 0711017. The proper HSS arrived a few hours later around 131305 of the same day, with solar wind speed groups of increasing from initiality of the same day, with solar wind speed groups of January, BZ oscillated wildly between 12 nf and 13 nf, preventing the development of a strong geomagnetic disturbance. As a result, only active geomagnetic conditions were observed on 26 and 27 January, while the rest of the week was at quiet levels with an occasional unsettled episode. Page 1. :Issued: 2021 Feb 08 1231 UTC :Product: documentation at http://www.sidc.be/products/tot # DAILY BULLETIN ON SOLAR AND GEOMAGNETIC ACTIVITY from the SIDC # Finding your way SIDC URSIGRAM 10208 in the PERPLEXED SIDC SOLAR BULLETIN 08 Feb 2021, 1230UT SIDC FORECAST (valid from 1230UT, 08 Feb 2021 until 10 Feb 2021) SOLAR FLARES : Quiet conditions (<50% probability of C-class flares) URSIgram BEWILDERED DISORIENTED GEOMAGNETISM : Quiet (A<20 and K<4) SOLAR PROTONS : Quiet PREDICTIONS FOR 08 Feb 2021 10CM FLUX: 074 / AP: 005 PREDICTIONS FOR 09 Feb 2021 10CM FLUX: 074 / AP: 004 PREDICTIONS FOR 10 Feb 2021 10CM FLUX: 075 / AP: 004 COMMENT: Solar activity was at very low levels. No numbered sun spots were observed on the solar disc. No significant flares were detected in the last 24 hours and none are expected in the next 24 hours. No Earth-directed coronal mass ejections (CMEs) were detected in the available coronagraph imagery. The greater than 10 MeV proton flux was at nominal levels in the past 24 hours and is expected to remain so in the next 24 hours. The greater than 2MeV electron flux remained under the 1000 pfu threshold and is expected to remain so in the next 24 hours. The 24h electron fluence was at nominal levels and is expected to remain so, although slight increase is possible due to the influence of the HSS currently affecting the Earth. Over the past 24 hours the solar wind conditions (ACE and DSCOVR) started to recover from the HSS which arrived to the Earth on Feb 6th. The total magnetic field varied between 0.8 nT an 6 nT and its Bz component weakly oscillated between -4 nT and 4 nT. The phi angle was predominantly positive reflecting the polarity of the coronal hole affecting the Earth. The solar wind speed showed a gradual decreased from 550 km/s to 410 km/s as the effect of the HSS starts to wane. The geomagnetic conditions over the past 24 hours were predominantly quiet with several unsettled periods and two isolated locally active conditions with K Dourbes equal to 4. Mostly quiet conditions are expected in the next 24 hours as the influence of the HSS continues to wane. Isolated unsettled to active periods remain possible. A shock is considered to have the following criteria, calculated using a 10 min average before and after the shock:

- A 20+ % increase in B, N (density), and T
- A 20+ km/s increase in V (speed)

ſ

This message is of the fast alert type. It is sent when quiet Space Weather conditions are expected for the next 48 hours or until further notice. This implies that:

- \* the solar X-ray output is expected to remain below C-class level,
- \* the K\_p index is expected to remain below 5,
- \* the high-energy proton fluxes are expected to remain below the event threshold.

All quiet alerts are send by the SWx forecaster, both to begin and to end the period.

The all quiet period is seldomly send during the solar cycle maximum, as new groups may quickly develop on disk or may round the east limb, or there may be filaments on disk that may result in flare/proton events.

The all quiet alert is also seldomly send during the ascending and declining phase as in view of the persistent high speed streams from coronal holes, as well as transients in the solar wind.

The criteria for the all quiet alerts are under debate.

# **Exercise: URSIgram**

- Which of the following topics is usually <u>not</u> mentioned in the daily URSIgram?
  - a. Visibility of the aurora
  - b. The flux of high energetic (≥ 2 MeV) electrons
  - c. Ionospheric scintillation

| <pre># DAILY BULLETIN ON SOLAR AND GEOMAGNETIC ACTIVITY from the SIDC #   (RWC Belgium) </pre>  |
| SIDC UDSIGNAM 10216<br>SIDC SOLAR BULLTIN 16 Feb 2021, 1230UT<br>SIDC SORCAST (valid from 1230UT, 16 Feb 2021 until 18 Feb 2021)<br>SIDC FORECAST (valid from 1230UT, 16 Feb 2021 until 18 Feb 2021)<br>GEOMAGNETISM : Active conditions expected (A>=20 or R=4)<br>SIDLAR FROTONS : Quiet  |
| FREDICTIONS FOR 16 Feb 2021 100CH FLUX: 070 / AF: 014<br>FREDICTIONS FOR 17 Feb 2021 100CH FLUX: 070 / AF: 012<br>FREDICTIONS FOR 18 Feb 2021 100CH FLUX: 070 / AF: 012<br>ORMENT: The solar activity has been quiet over the past 24 hours. The<br>visible solar disc is spotless and the X-ray flux is below B-level. The<br>solar activity is expected to remain at low levels over the next 24 hours.   |
| No Earth-directed coronal mass ejections (CMEs) was observed in the available coronagraph imagery.  |
| The greater than 10 MeV proton flux was at nominal levels in the past 24 hours and is expected to remain so in the next 24 hours. The greater than 2MeV electron flux remained under the 1000 pfu threshold and is expected to remain so in the next 24 hours.  |
| Over the past 24 hours the solar wind speed remained alow between 320 km/s and 375 km/s, the total magnetic field Solvy increased up 10 at and the Br component ranged between -8.8 mT and 7.8 mT being mostly negative since February 16 at 02100 UTC. The solar wind parameters indicate that the solar wind is slightly compressed ahead of the expected high-speed screams associated with the extension of the northern polar cornal hole (positive polarity, and facing Earth or Pebuary 13). The enhancements of the solar wind conditions are expected to persist with the speed increasing . |
| The germagnetic conditions over the past 24 hours were active in response<br>to the enhanced interplaneary magnetic field and the prolonged period of<br>southward directed BS component. Unsettled conditions are expected for the<br>next 24 hours with possible active periods due to the enhancement of the<br>solar wind parameters as long as Earth remains under the influence of the<br>coronal hole wind speed.  |

### Space Weather into practice – URSIgram exercises

Jan Janssens

SIDC URSIGRAM 30515 SIDC SOLAR BULLETIN 15 May 2013, 1205UT SIDC FORECAST (valid from 1230UT, 15 May 2013 until 17 May 2013) SOLAR FLARES : Major flares expected (X-class flares expected, probability >=50%) GEOMAGNETISM : Active conditions expected (A>=20 or K=4) SOLAR PROTONS : Proton event expected (10 pfu at >10 MeV) PREDICTIONS FOR 15 May 2013 10CM FLUX: 150 / AP: 017 PREDICTIONS FOR 16 May 2013 10CM FLUX: 152 / AP: 014 PREDICTIONS FOR 17 May 2013 10CM FLUX: 153 / AP: 011

COMMENT:A class X1.2 solar flare occurred today with peak time 01:48 UT, from NOAA AR 1748 which has a beta-gamma-delta magnetic configuration. It was associated with radio bursts and an increase of GOES proton flux levels, now at 5 protons/cm2-s-sr, the threshold of 10 protons/cm2-s-sr will likely be reached soon (at >=10 MeV). The increases in proton flux likely come from the CME driven shock. If the strong flares from this AR continue, the proton increases will likely be more abrupt when the magnetic connection between the flare site and the Earth is better (i.e. when the AR is in the western hemisphere). A CME was associated with the event, a shock and glancing blow can probably be expected at the Earth late on May 16 (CME speed 1700 km/s in LASCO C2).

Geomagnetic conditions are quiet, but ACE data shows a disturbance starting this morning, with currently magnetic intensity close to 15 nT (northwards, so no geomagnetic effect). There is not enough data yet to discern clearly its cause, but it is likely related to the CME on May 12 (and possibly those from the two previous days related to X-flares from NOAA AR 1748). Geomagnetic conditions are expected to be unsettled to active, with possible isolated minor storm periods.

TODAY'S ESTIMATED ISN : 099, BASED ON 11 STATIONS.

## URSIgram – Exercise 1

### • <u>Setting</u>

- You have received the above URSIgram. It is now 18:00UT on 15 May 2013. You have to brief your SWx colleagues.
- <u>Questions Part 1 of 2: Reading-Comprehension questions</u>
  - Was the X1.2 flare: a) a strong flare (which class)? b) a long duration event (LDE)?
  - What kind of radio burst (SRB) is type «IV/2II/1»?
  - 'Active geomagnetic conditions' correspond to which NOAA scale?
  - ' protons/cm2-s-sr ': This is the unit for which parameter? What is the short notation for this unit?
  - Despite the relatively strong magnetic field strength of 15 nT, no strong geomagnetic effects were recorded from this CME. Why?
  - 'Beta-Gamma-Delta': What's the name of the corresponding active region classification scheme? What is the simplest type possible?
  - For the geomagnetic prediction of 15 May, why is A >= 20 while Ap=17?
  - What is being evaluated under the column « OP »?

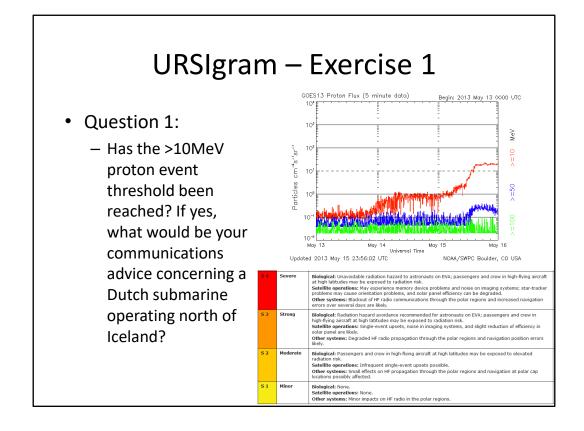

## URSIgram – Exercise 1

### <u>Setting</u>

- You have received the above URSIgram. It is now 18:00UT on 15 May 2013. You have to brief your SWx colleagues.
- <u>Questions Part 2 of 2: SWx impact questions</u>
  - Has the >10MeV proton event threshold been reached? If yes, what would be your communications advice concerning a Dutch fregate operating north of Iceland?
  - You received a report from Gilze-Rijen Air Base (The Netherlands) about HF radio communication problems around 01:45UT. Do you think they were related to the X1.2 flare?
  - With the LASCO/C2 data now fully available, do you agree (part of) the CME is headed for Earth? Why (not)?
  - Was the X1.2 event a Tenflare? Do you think the 10.7 cm radio flux of 20:00UT will be affected?
  - « ... possible isolated minor storm periods. » Do you expect important satellite communications problems?

Γ

The daily values for the 10.7cm radio flux can be found at Penticton: http://www.spaceweather.ca/solarflux/sx-4a-en.php SWPC/NOAA: ftp://ftp.swpc.noaa.gov/pub/lists/radio/rad.txt

For 14 & 15 May, the Penticton values were as follows:

| Date       | Time Ju  | ulian day Ca | arr. Rot. Ob | served F | lux Adjusted Flux | URSI Flux |
|------------|----------|--------------|--------------|----------|-------------------|-----------|
| 2013-05-14 | 17:00:00 | 2456427.197  | 2136.996     | 148.1    | 151.4             | 136.2     |

SIDC URSIGRAM 50623 SIDC SOLAR BULLETIN 23 Jun 2015, 1242UT SIDC FORECAST (valid from 1230UT, 23 Jun 2015 until 25 Jun 2015) SOLAR FLARES : M-class flares expected (probability >=50%) GEOMAGNETISM : Major magstorm expected (A>=50 or K>=6) SOLAR PROTONS : Proton event in progress (>10 MeV) PREDICTIONS FOR 23 Jun 2015 10CM FLUX: 135 / AP: 038 PREDICTIONS FOR 24 Jun 2015 10CM FLUX: 130 / AP: 038 PREDICTIONS FOR 25 Jun 2015 10CM FLUX: 125 / AP: 018 COMMENT: NOAA active region 2371 produced an M6.5 flare, peaking at 18:23 UT on June 22. An associated full halo CME erupted, with first measurement in LASCO C2 at 18:36 UT on June 22 and has a projected speed around 1000 km/s . A few filament eruptions were recorded in the Northwest quadrant, first a small one around 22:00 UT and then an extended one starting near 4:24 UT. Coronagraphic data indicate the occurrence of (mainly westward) CMEs, but incomplete data currently prohibit full analysis. Proton levels have descended from the peak of 1070 pfu (19UT), despite some smaller peaks and are around 30 pfu at the moment. NOAA AR 2367 is now close to the West limb and could, in case of further eruptions, elevate the proton levels again. The proton levels might also be enhanced at the expected June 22 CME arrival. Flares at the M-level are expected, with some chance (15%) for a flare at the X-level. A shock arrived to the ACE spacecraft at 18:01 UT on June 22, marking the expected arrival of the June 21 CME. The interplanetary magnetic field (IMF) magnitude jumped to 42 nT, with long periods of negative Bz down to -39 nT. Solar wind speeds reached values between 600 and 780 km/s. The IMF magnitude has declined to a current value of 12 nT. Minor to severe geomagnetic conditions were recorded, with severe levels between 18 and 21 UT (on June 22) and between 3 and 6 UT (on June 23). The local K at Dourbes reached K=8 at 22 UT (on June 22). A decline to unsettled levels is expected for the coming hours. Further minor to major storm levels are expected, following the expected arrival of June 22 CME around 12:00 UT on June 24. TODAY'S ESTIMATED ISN : 042, BASED ON 14 STATIONS. SOLAR INDICES FOR 22 Jun 2015 WOLF NUMBER CATANIA : 083 10CM SOLAR FLUX : 135 AK CHAMBON LA FORET : 108 :/// AK WINGST ESTIMATED AP :073 ESTIMATED ISN : 047, BASED ON 23 STATIONS.

## URSIgram – Exercise 2

### <u>Setting</u>

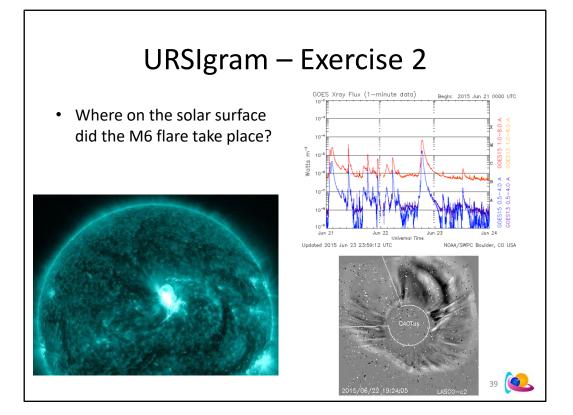

You have received the above URSIgram (23 June 2015 – 12:42UT). You have to brief your SWx colleagues.

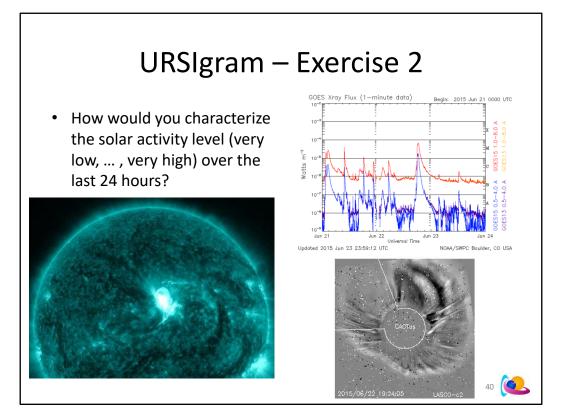

### <u>Questions</u>

- Where on the solar surface did the M6 flare take place?
- How would you characterize the solar activity level (very low, ..., very high) over the last 24 hours?
- Did the M6 flare affect the daily 10.7cm radio flux of 22 June?
- A proton event is in progress.
  - Do you (still) expect a GLE?
  - What would you recommend concerning arctic polar flights?
- In terms of Dst, how strong would you expect this event to be (Quiet, ..., Extreme)?
- Based on the description of the geomagnetic storm:
  - Would you expect major satellite problems from deep di-electric charging?

38 🤇

Would you expect degradation of GNSS applications (WAAS,...)?

## URSIgram – Exercise 2

TODAY'S ESTIMATED ISN : 042, BASED ON 14 STATIONS.

Did the M6 flare affect the ٠ daily 10.7cm radio flux of 22 June?
