

# BRAM: Reanalysis of stratospheric chemical composition based on Aura MLS

Quentin Errera ([quentin@oma.be](mailto:quentin@oma.be)), Simon Chabrillat, Yves Christophe and Sergey Skachko

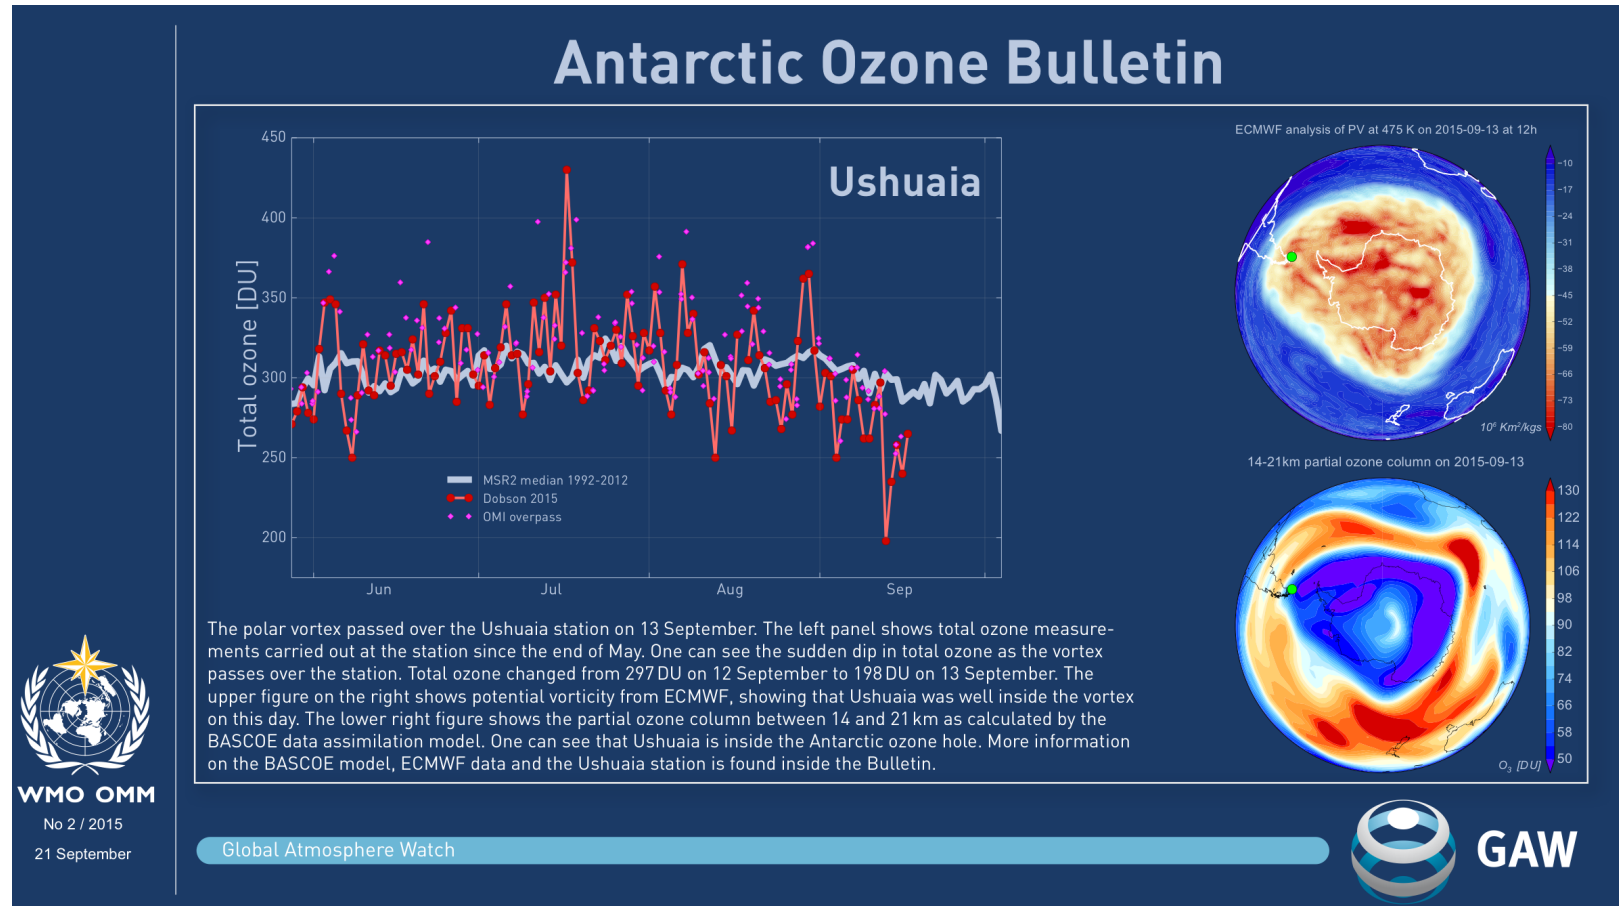

Royal Belgian Institute for Space Aeronomy (BIRA-IASB)

13<sup>th</sup> SPARC DA workshop, 25-27 Oct 2017, ECMWF, Reading, UK

# Motivations

- BASCOE produces operational analyses of MLS since 2009 for the validation of MACC O<sub>3</sub> (Lefever et al., 2015)
- For this service, BASCOE assimilates O<sub>3</sub>, H<sub>2</sub>O, HNO<sub>3</sub>, N<sub>2</sub>O, HCl and ClO
- These analyses are used by WMO Global Atmospheric Watch (GAW) to monitor Ozone and related trace gases and to interpret ground-based observations
- A reanalysis of MLS was requested by WMO GAW
- **BRAM: BASCOE Reanalysis of Aura MLS 2004-2016 (will be continued)**

# Outline

- BASCOE setup
- Observational setup
- Evaluation of BRAM
- Where to find BRAM dataset?
- Conclusions

# Setup of BASCOE (Belgian Assimilation System of Chemical Observations)

- CTM with 58 stratospheric species (Errera et al., ACP, 2008)
  - Advection: FFSL (Lin & Rood, MWR, 1996)
  - Chemistry:  $\approx 200$  chemical reactions (gas phase, heterogeneous, photolysis)
  - Parameterization of PSC microphysics
  - Dehydration of  $H_2O$  in the stratosphere
- Dynamics (winds and  $T^\circ$ ) from ERA-Interim with resolution:
  - $2.5^\circ$  lat x  $3.75^\circ$  lon x 37 levels (surf to 0.1 hPa, 25 levels above 100 hPa)
- Time step: 30'
- DA method: **EnKF** (Skachko et al., GMD, 2014, 2016) chosen due to its better scalability on HPC than 4D-Var

- Assimilated observations
  - Aura MLS Version 4.2x
  - O<sub>3</sub>, H<sub>2</sub>O, HCl, ClO, HNO<sub>3</sub>, N<sub>2</sub>O (190-GHz), CO, CH<sub>3</sub>Cl
    - These are the species that do not need to be averaged
  - Prepare according to MLS Data Quality Document
    - Pressure ranges of validity, cloud screening, ...
- Monitored independent observations (for validation)
  - **ACEFTS v3.6, MIPAS IMK, MIPAS ESA v6, WOUDC ozonesondes, O3\_CCI**  
L2 profiles, SMILES
  - To be done: MIPAS ESA v7

# BRAM vs other reanalysis

## Status of existing constituents reanalysis

- Meteorological reanalyses usually only consider  $O_3$  in the stratosphere
- Same for MACC/CAMS reanalysis (Inness et al. 2013, Flemming et al. 2017)
- van der A et al. (2010) has produced a 30-year  $O_3$  TC reanalysis (no profiles) based on multi-sensor assimilation
- Miyazaki et al. (2015) has produced a 7-year multi-species reanalysis for the tropospheric composition

BRAM is the first reanalysis that focus on the stratospheric composition with other species than  $O_3$

# Evaluation of BRAM reanalysis: strategy

- Evaluation of BRAM in different stratospheric region of interest
  - Mid-stratosphere
  - Winter pole in the lower stratosphere
  - Winter pole in the upper stratosphere
  - UTLS
  - USLM

# Evaluation of BRAM reanalysis: strategy

Atm. Conditions	Vertical Ranges	Latitude ranges	Season	Species
Middel Stratosphere	3-70 hPa	60°S-60°N	-*	O <sub>3</sub> , H <sub>2</sub> O, HCl, ClO, HNO <sub>3</sub> , N <sub>2</sub> O, CH <sub>3</sub> Cl
PSC	10-100 hPa	South pole region	JJA or SON	O <sub>3</sub> , H <sub>2</sub> O, HCl, ClO, HNO <sub>3</sub> , N <sub>2</sub> O
Descent of meso. air	0.1-6.8 hPa	South pole region	JJA	H <sub>2</sub> O, HNO <sub>3</sub> , CO
USLM	0.1-3 hPa	Tropics	-*	H <sub>2</sub> O, HCl
Tropical UTLS	68-200 hPa	Tropics	JJA	O <sub>3</sub> , H <sub>2</sub> O, CO, CH <sub>3</sub> Cl, (HCl?, HNO <sub>3</sub> ?)
Mid-lat. UTLS	68-200 hPa	Tropics	-*	O <sub>3</sub> , H <sub>2</sub> O, CO, CH <sub>3</sub> Cl, (HCl?, HNO <sub>3</sub> ?)

\*: in these cases, JJA has been chosen arbitrarily

O<sub>3</sub> not assimilated in the USLM, see Jonas Debosscher's poster

# Error covariances in BRAM

- Forecast covariances estimated from ensemble covariances (20 members)
- For each species, observational variances scaled using Desroziers's method (Desroziers et al., 2005) which states:

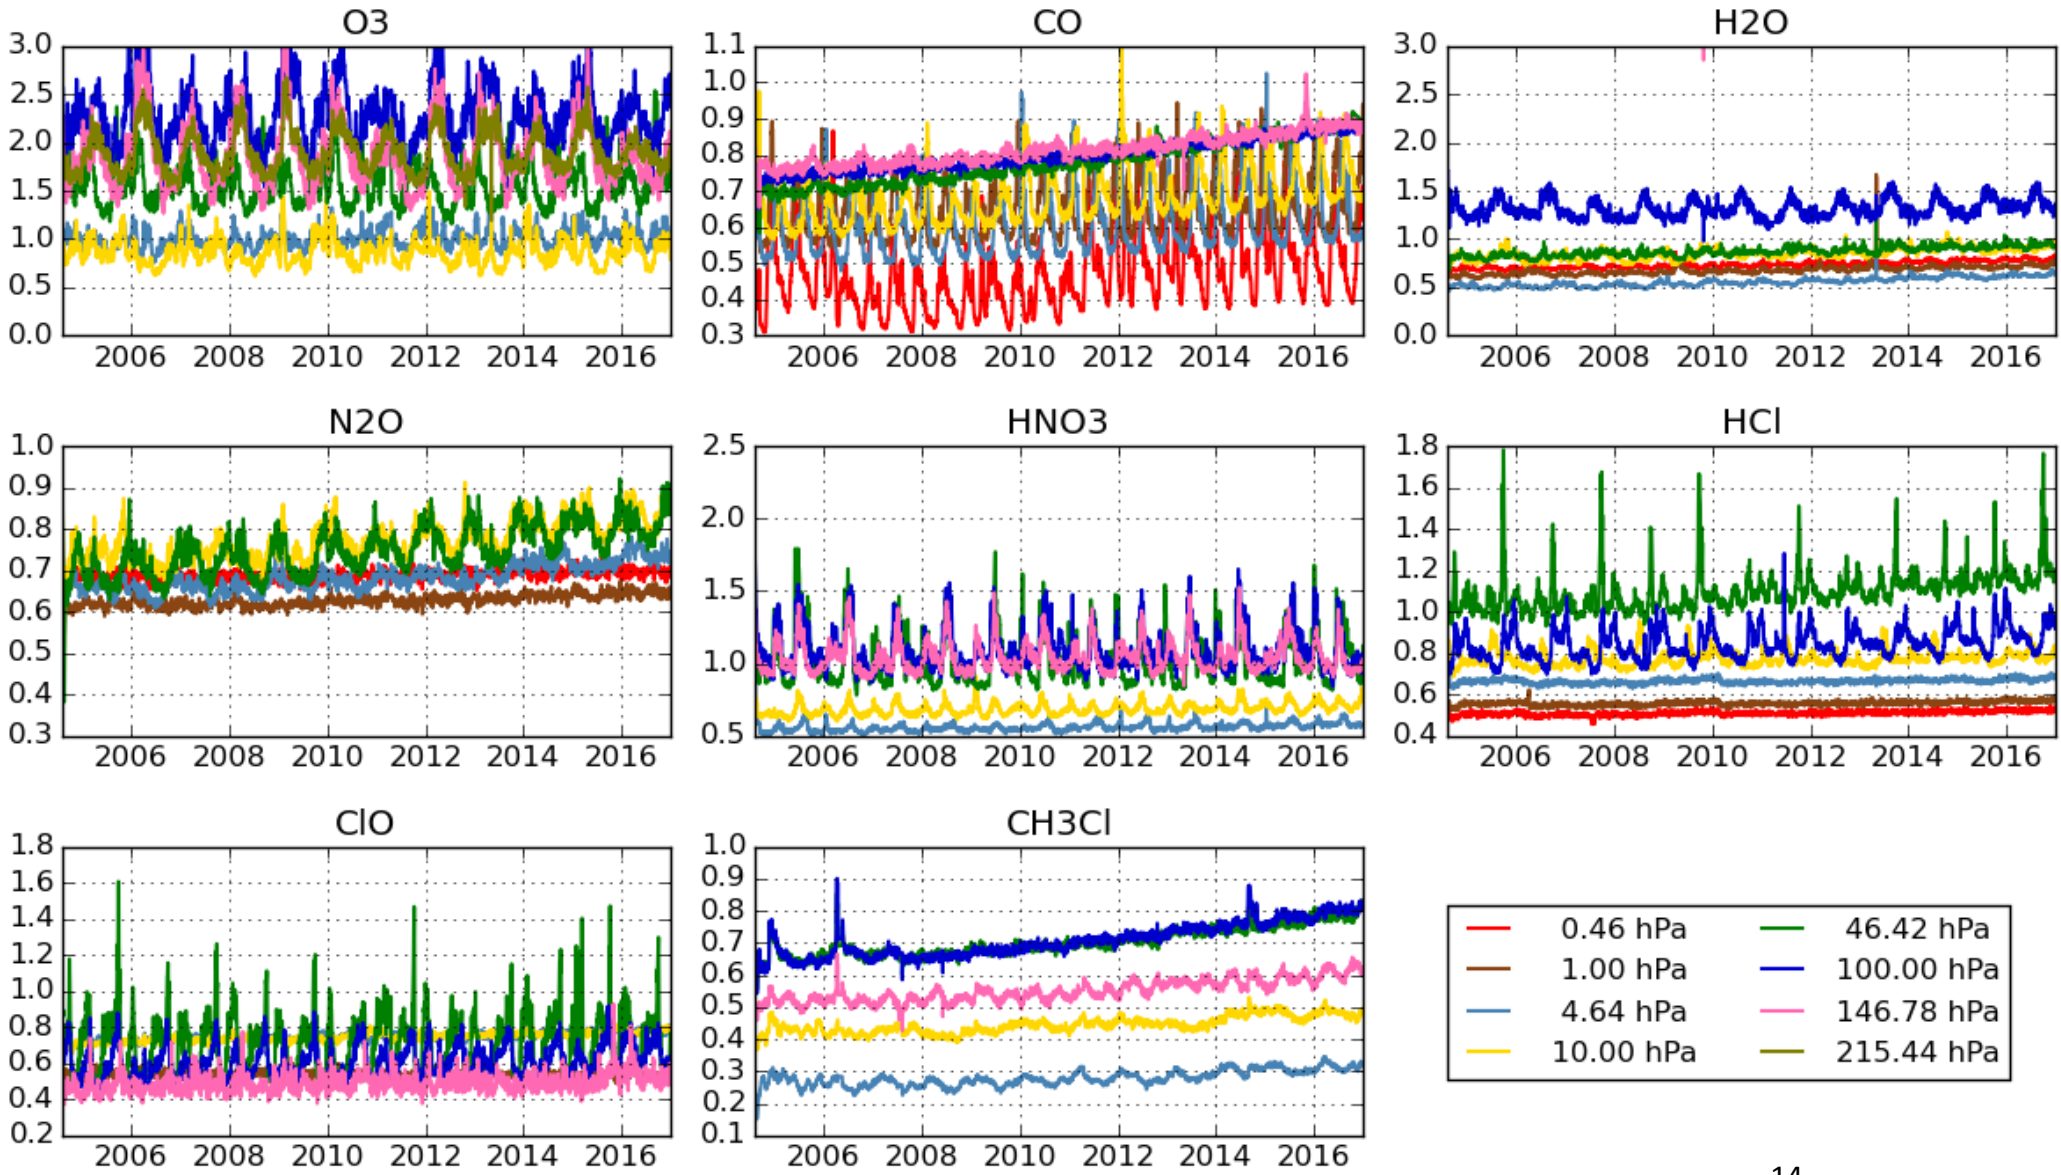

- Knowing that: 
$$\sigma_o^2 = \langle (\underbrace{\mathbf{y}^o - \mathbf{H}\mathbf{x}^a}_{\text{Analysis innovations}})(\underbrace{\mathbf{y}^o - \mathbf{H}\mathbf{x}^b}_{\text{Forecast innovations}})^T \rangle$$

**Top: 2008**  
 timeseries of MLS partial column [10-100] hPa averaged between 90°S-60°S for 5 key constituents involved in O3 hole development and corresponding values of BRAM and CTRL

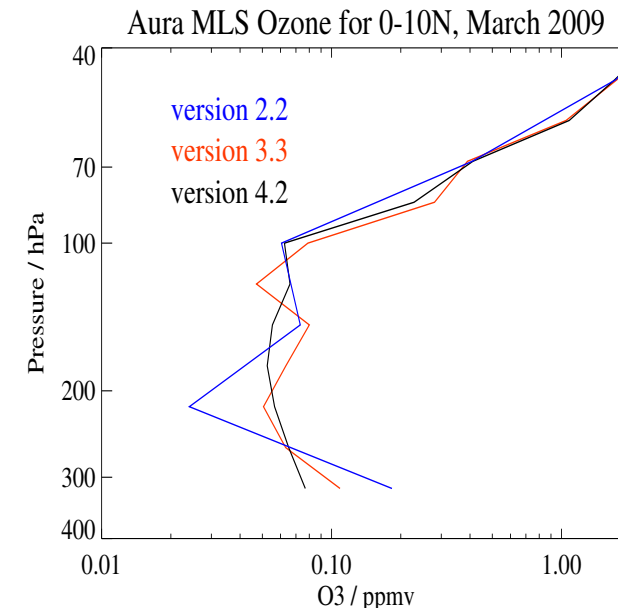

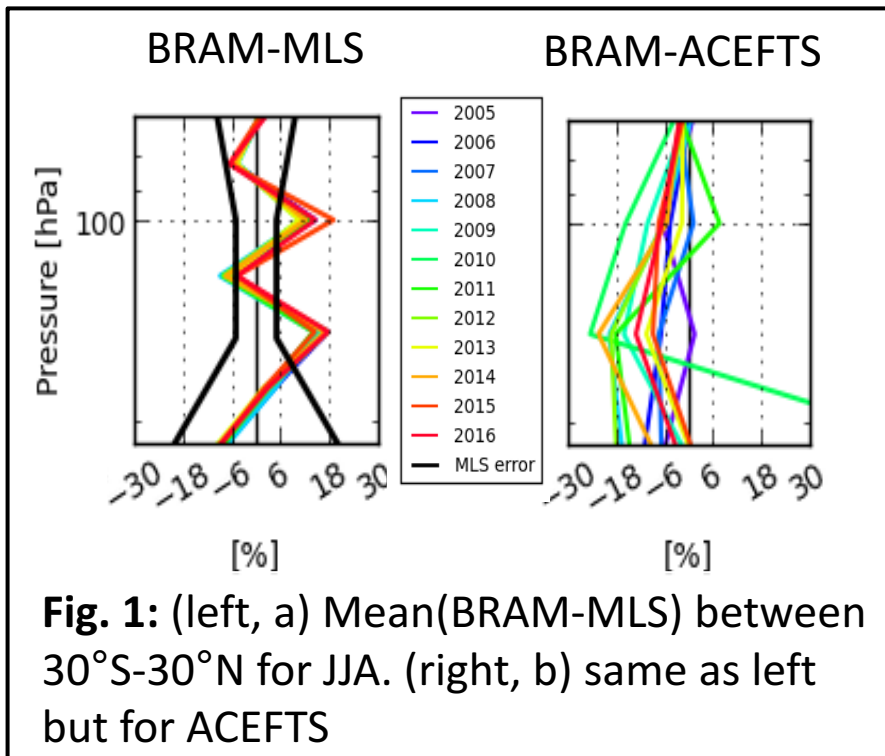

**Bottom: Timeseries**  
 of the differences BRAM-MLS for 2004-2016

- BRAM corrects most of the deficiencies of the model (I.C. and physics)
- ... and highlights systematic errors in the PSC scheme of the model

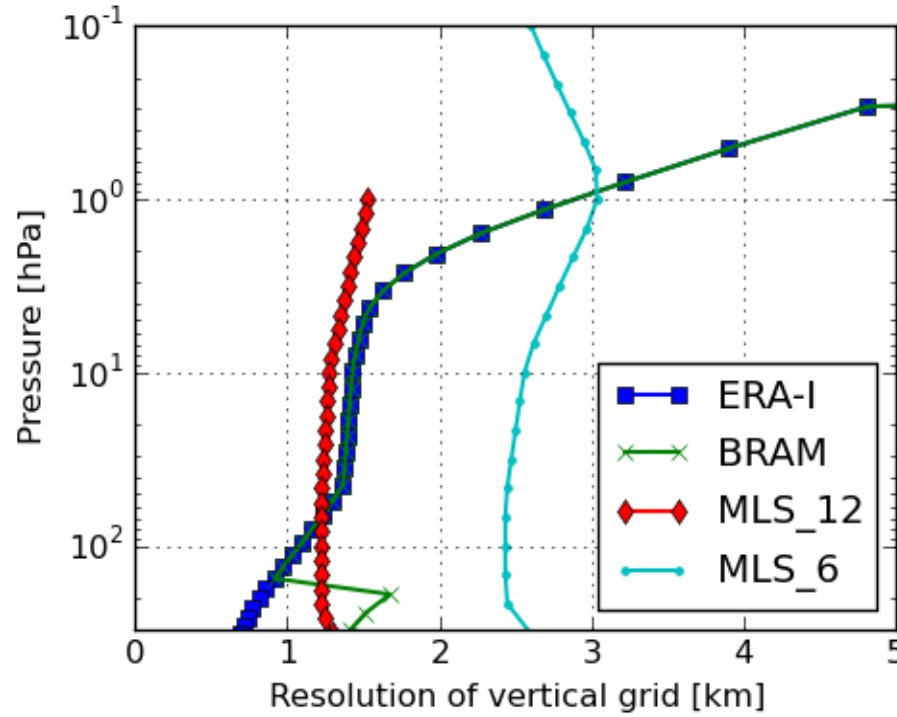

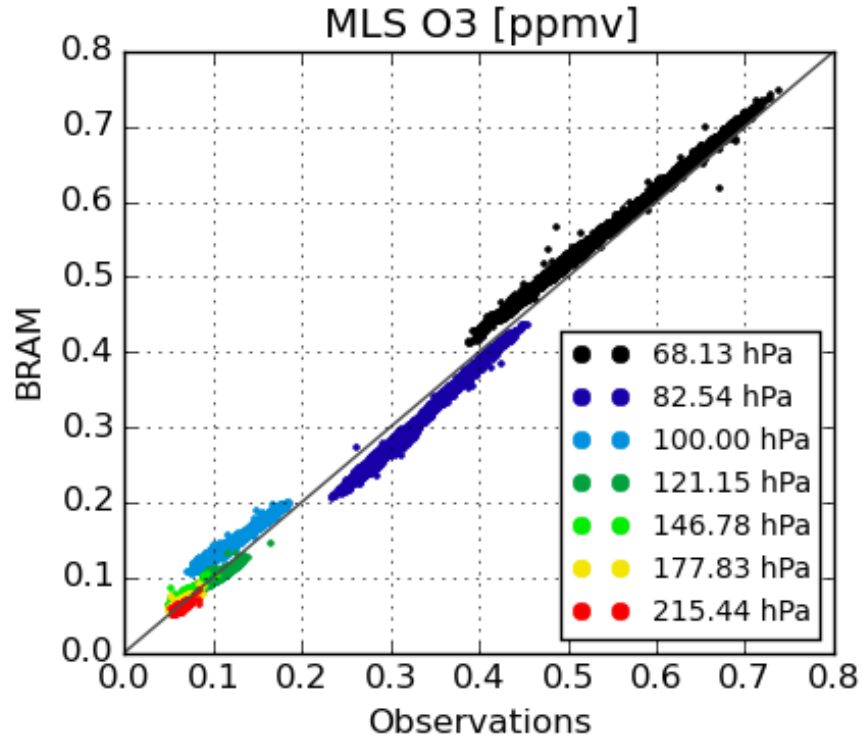

# Tropical UTLS

# BRAM O<sub>3</sub> in the tropical UTLS

- BRAM vs MLS in UTLS exhibits vertical oscillations for O<sub>3</sub> (Fig. 1a)
- Not seen in BRAM vs ACEFTS (Fig. 1b)
- Probably due to oscillation in MLS O<sub>3</sub> v4.2 (see MLS DQD), although improvements since v2.2 (Fig. 2)

# BRAM O<sub>3</sub> in the tropical UTLS

**Left:** Daily mean MLS O<sub>3</sub> in the tropical UTLS (30°S-30°N) and the BRAM corresponding values.

**right:** Resolution of vertical grid of ERA-I, BRAM, MLS 6 and 12 levels per decade of pressure

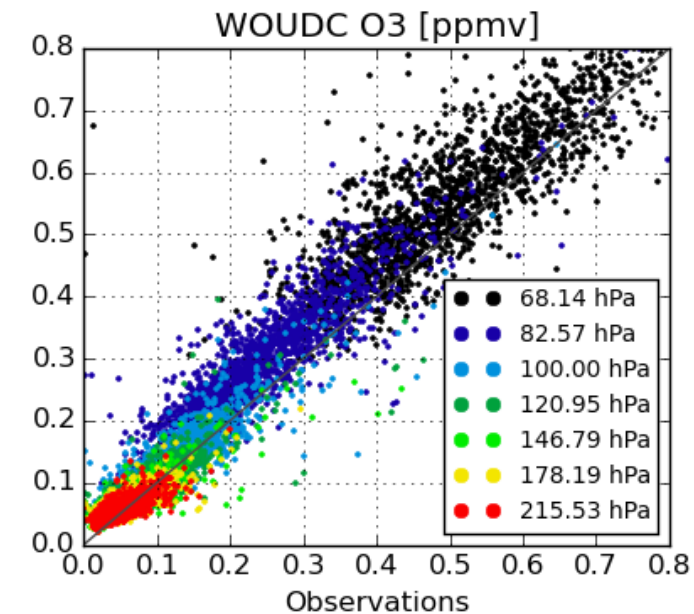

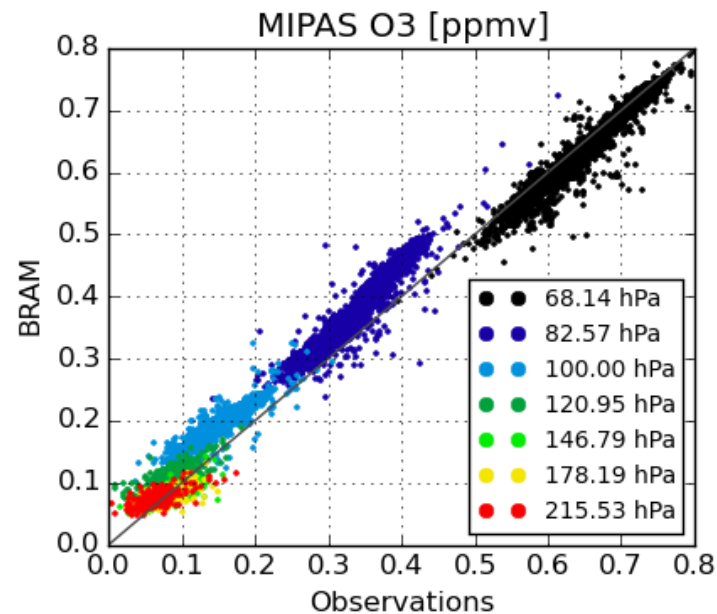

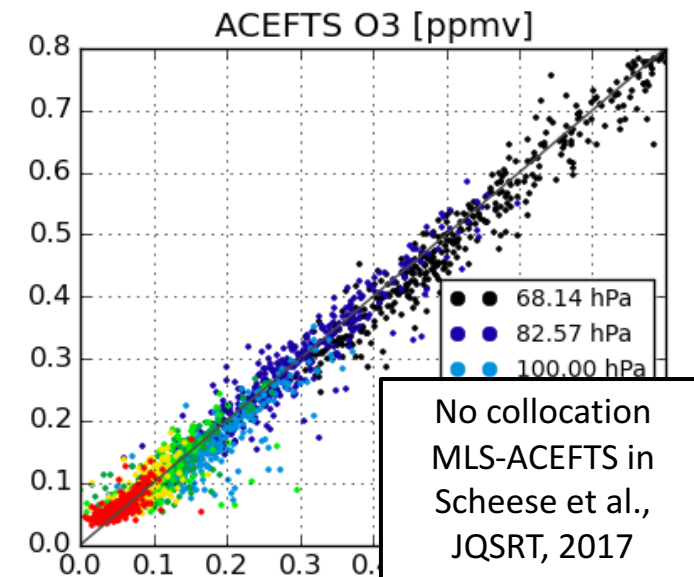

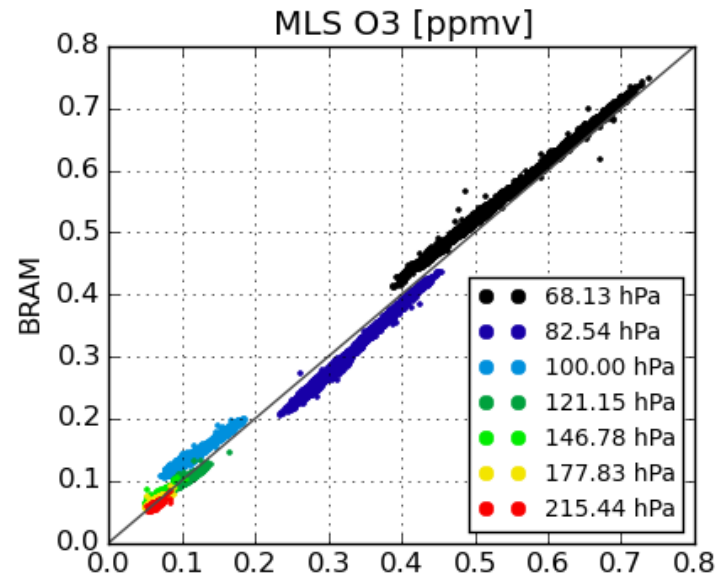

BRAM cannot reproduce MLS in tropical UTLS because:

- Vertical oscillation in MLS
- MLS and BRAM vertical grid have similar resolution

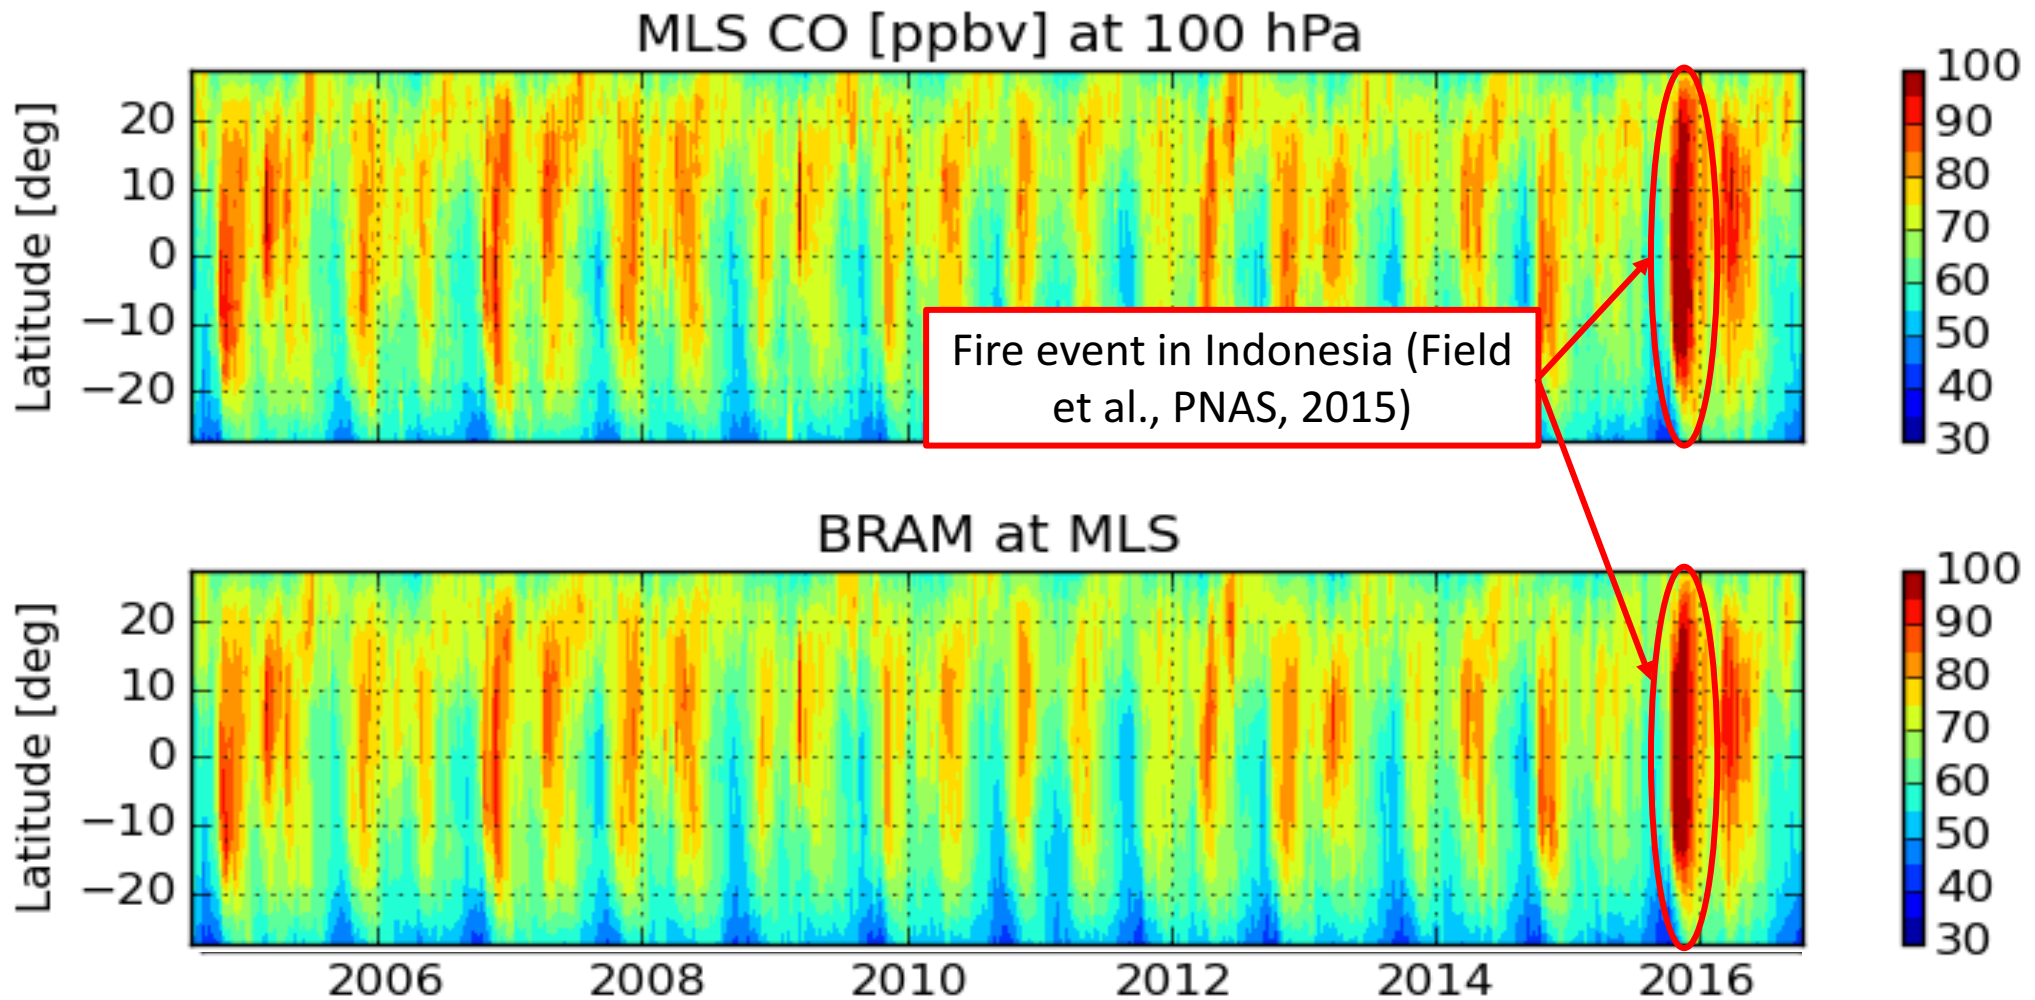

# BRAM O<sub>3</sub> in the tropical UTLS

- BRAM highlight systematic differences between different instruments
- Good agreement with ACEFTS
- Could BRAM be used as transfer function between different observational datasets to estimate (and correct) their systematic differences?

# BRAM CO in the tropical UTLS

- CO at 100 hPa: very good agreement between BRAM and MLS

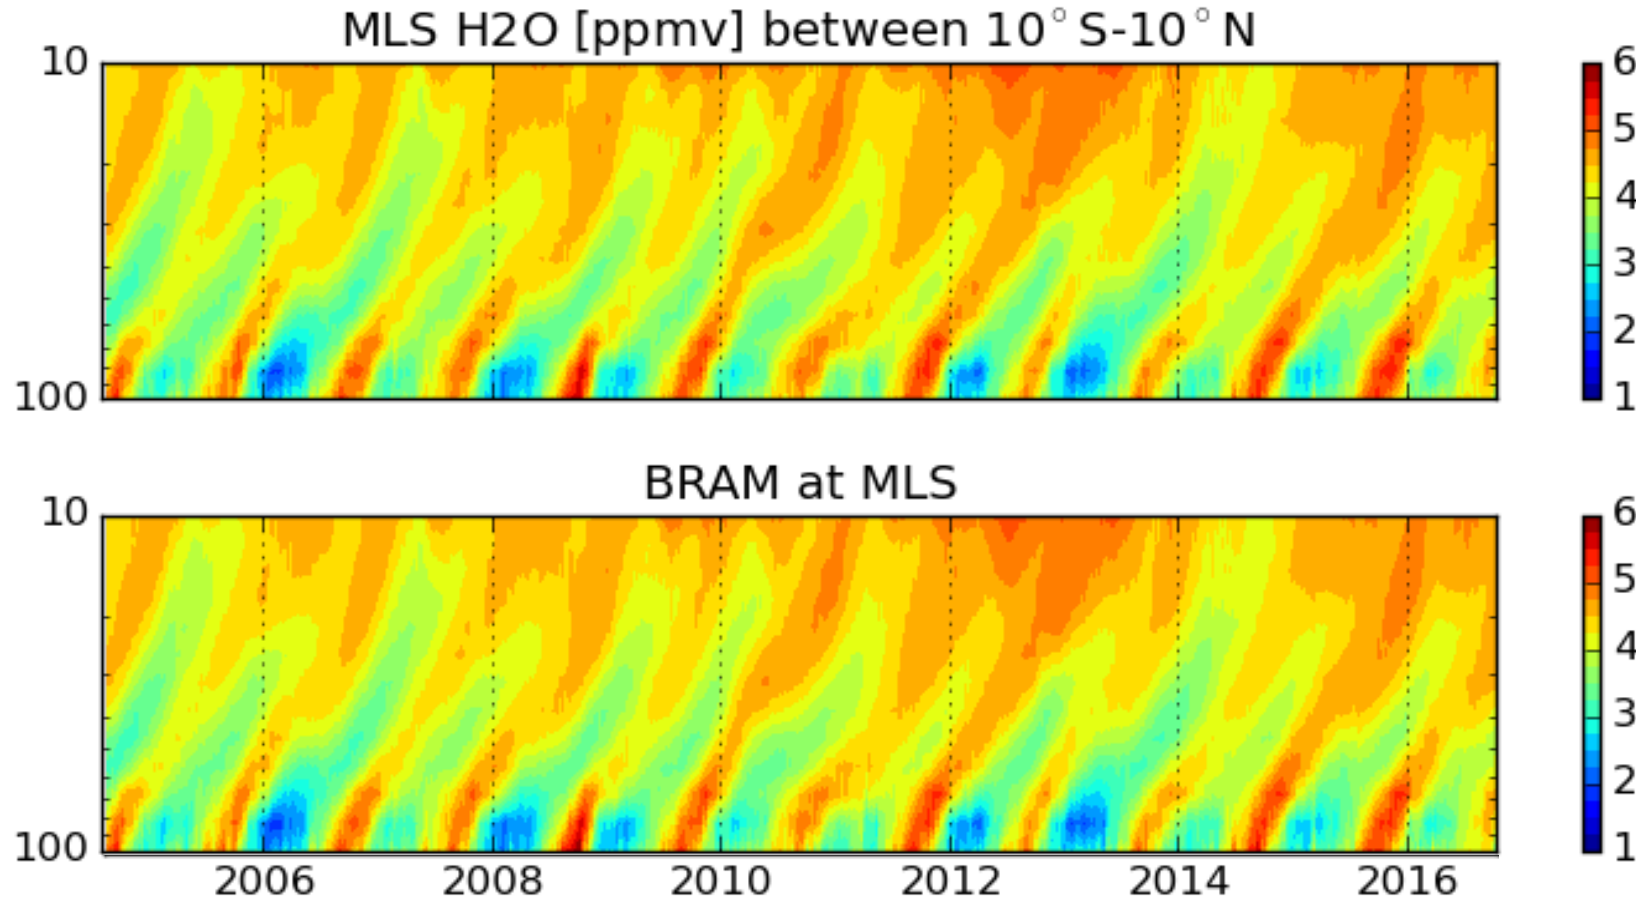

# BRAM CO in the tropical UTLS

Daily mean CO in the tropical UTLS (30°S-30°N) from observations and the BRAM corresponding values.  
Left to right: MLS, ACEFTS and MIPAS

- BRAM highlight systematic differences between different instruments
- Could BRAM be used as transfer function between different observational datasets to estimate (and correct) their systematic differences?

# BRAM H<sub>2</sub>O Tape Recorder

**Top:** time series of mean MLS H<sub>2</sub>O between 10°S-10°N  
**Bottom:** Corresponding BRAM values

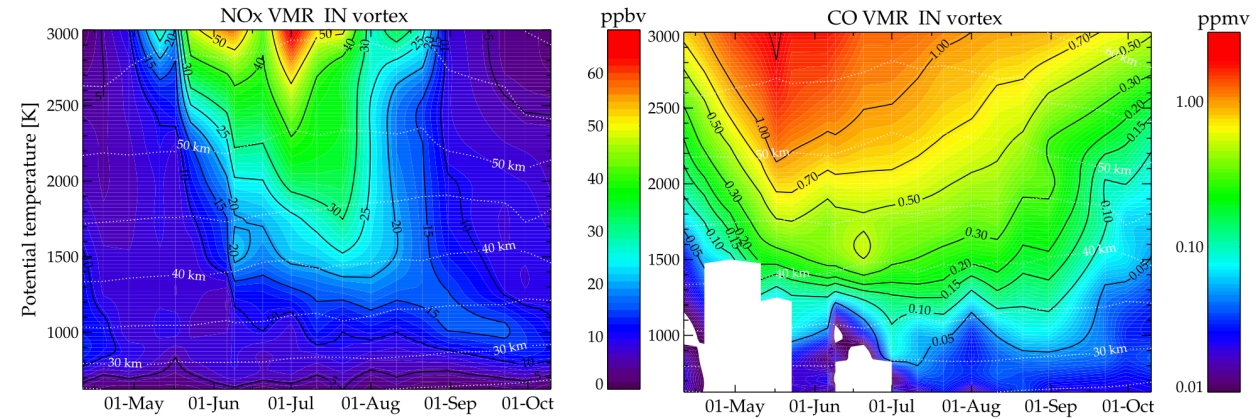

- H<sub>2</sub>O Tape recorder (Mote et al., JGR, 1996)
  - Very good agreement between BRAM and MLS
  - Might be useful to evaluate vertical transport of CCMs/GCMs

# Descend of mesospheric air

# Winter Pole in the upper stratosphere (South Pole)

- USLM polar winter characterized by descend of mesospheric air in the stratosphere (CO, NO<sub>x</sub>, H<sub>2</sub>O)
- Good representation of CO descent by BRAM while no source of CO at model lid
- HNO<sub>3</sub> enhancement (due to NO<sub>x</sub> descent) well capture by BRAM
- Nevertheless, EnKF cannot correct NO<sub>x</sub> (not shown)

Time evolution of NO<sub>x</sub> and CO in May-Aug 2003 measured by MIPAS IMK (Funke et al., JGR, 2005)

# Getting the BRAM dataset

- **BRAM Release 1 is available**
  - Only assimilated species plus  $\text{Cl}_2\text{O}_2$  will be delivered:
    - $\text{O}_3$ ,  $\text{H}_2\text{O}$ ,  $\text{HCl}$ ,  $\text{ClO}$ ,  $\text{Cl}_2\text{O}_2$ ,  $\text{HNO}_3$ ,  $\text{N}_2\text{O}$ ,  $\text{CO}$ ,  $\text{CH}_3\text{Cl}$
  - File format: NetCDF-CF, one file per year per species
  - BRAM datasets available on BIRA-IASB ftp site
  - To get login/pw, contact [quentin@aeronomie.be](mailto:quentin@aeronomie.be)
  - Website: [strato.aeronomie.be](http://strato.aeronomie.be) -> Datasets -> BRAM

# Conclusions and perspectives

- BASCOE EnKF successfully assimilate MLS observations of O<sub>3</sub>, H<sub>2</sub>O, HCl, ClO, HNO<sub>3</sub>, N<sub>2</sub>O, CO, CH<sub>3</sub>Cl for 2004-2016
- ... but also highlight:
  - Model deficiencies (PSC microphysics, model O<sub>3</sub> deficit, ...)
  - Instrumental issues (O<sub>3</sub> vertical oscillations in MLS, MLS CO bias...)
    - Could BRAM be useful to correct systematic differences between different instruments (MLS, ACEFTS, MIPAS, O3 sondes)?
- Would the replacement of ERA-Interim by ERA5 improve BRAM?
- This work also suggests themes for DAWG 2019-2022
  - Assessing (and correct) systematic difference between instruments using DA

Thank you for your attention!

# What about unobserved species?

- Little attention yet given to other species than:  $O_3$ ,  $H_2O$ ,  $HCl$ ,  $ClO$ ,  $HNO_3$ ,  $N_2O$ ,  $CO$ ,  $CH_3Cl$
- Here, example for  $NO_x$  ( $NO+NO_2$ )
  - BRAM overestimates MIPAS ESA and is closer to a CTM
