

The SPARC Data Initiative - A multi-instrument comparison of stratospheric limb measurements

Susann Tegtmeier

GEOMAR Helmholtz Centre for Ocean Research Kiel, Germany

and the SPARC Data Initiative Team

7th Atmospheric Limb Conference, Bremen, 2013

Motivation

Knowledge of quality of different satellite data sets
needs to be improved for different applications:

- ☐ Tracer scenario validation (Montreal Protocol, Cl_y)
- ☐ Model validation projects (CCMI, IPCC)
- ☐ Trend analyses (e.g., stratospheric water vapour)
- ☐ Empirical studies of stratospheric climate and variability

Objectives

Inter-comparison of vertically resolved climatologies of 25 chemical tracers and aerosol from 18 multi-national satellite instruments

- ☐ Will be published as a **peer-reviewed SPARC report**, as well as in journal publications
- ☐ Will summarize useful information and highlight differences between data sets
- ☐ Will provide guidance to space agencies about required improvements in existing data sets and future observations

Team: ✓ HALOE (UARS): **John Anderson**
✓ MLS (Aura/UARS): **Lucien Froidevaux, Ryan Fuller**
✓ TES (Aura): **Jessica Neu**
✓ ACE-FTS (SCISAT-1): **Kaley Walker, Ashley Jones**
✓ MAESTRO: **Kaley Walker**

Co-leads:

Michaela Hegglin

Susann Tegtmeier

✓ OSIRIS (Odin): **Doug Degenstein, Adam Bourassa**
✓ SMR (Odin): **Joachim Urban**
✓ MIPAS (ENVISAT): **Thomas von Clarmann, Bernd Funke**
✓ SCIAMACHY (ENVISAT): **Alexei Rozanov**
✓ GOMOS (ENVISAT): **Erkki Kyrölä**
✓ SAGE I / II / III: **Ray Wang**
✓ HIRDLS (AURA): **John Gille, Lesley Smith**
✓ SMILES (ISS): **Yasuko Kasai**
✓ LIMS (NIMBUS-7): **Ellis Remsberg, Gretchen Lingenfelser**
✓ POAM II / III: **Jerry Lumpe**
✓ **Matthew Toohey**

TES

‘Climatologies’

- Monthly mean zonal mean time series
 - ❑ **VMR or aerosol extinction coefficients,**
 - ❑ 1σ standard deviation,
 - ❑ number of measurements per grid box,
 - ❑ mean, min, and max local solar time,
 - ❑ average day of month and latitude.
- Range: upper troposphere to the lower mesosphere
- Time period covered: 1978 - 2010
- Grid: 5° latitude bins on the CCMVal-2 pressure grid (28 levels)
- Data sets are provided in a common format (netcdf) easily useable by the atmospheric science community

SDI report

- SPARC report no. 7
- All chapters written, most typeset, some in proof read
- Publication in 2015/2016

SPARC No. 7

SPARC
Stratosphere-troposphere
Processes And their Role in Climate

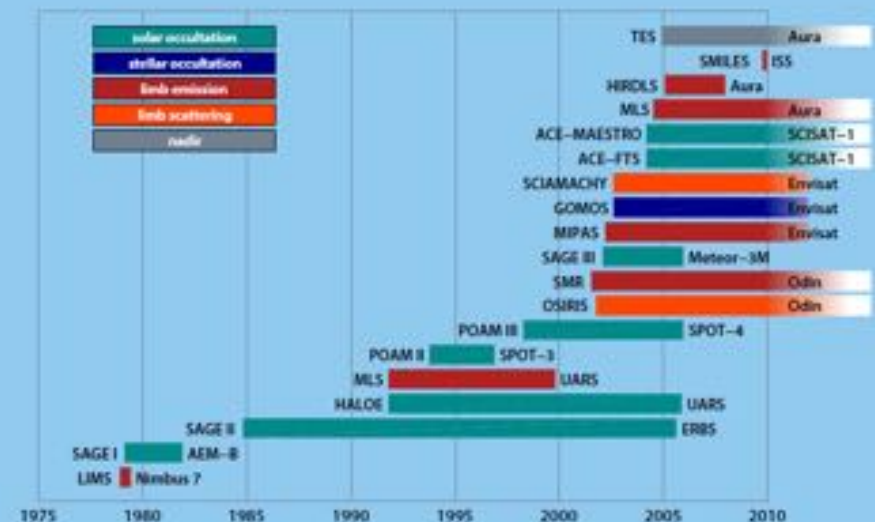

Core Project of the WMO/ICSU/IOC
World Climate Research Programme

The SPARC Data Initiative: Assessment of stratospheric trace gas and aerosol climatologies from satellite limb sounders

**The SPARC Data Initiative:
Assessment of stratospheric trace gas and
aerosol climatologies from satellite limb sounders**

Edited by M. I. Hegglin and S. Tegtmeier

SPARC Report No. 7, WCRP-01/2015,
February/2015

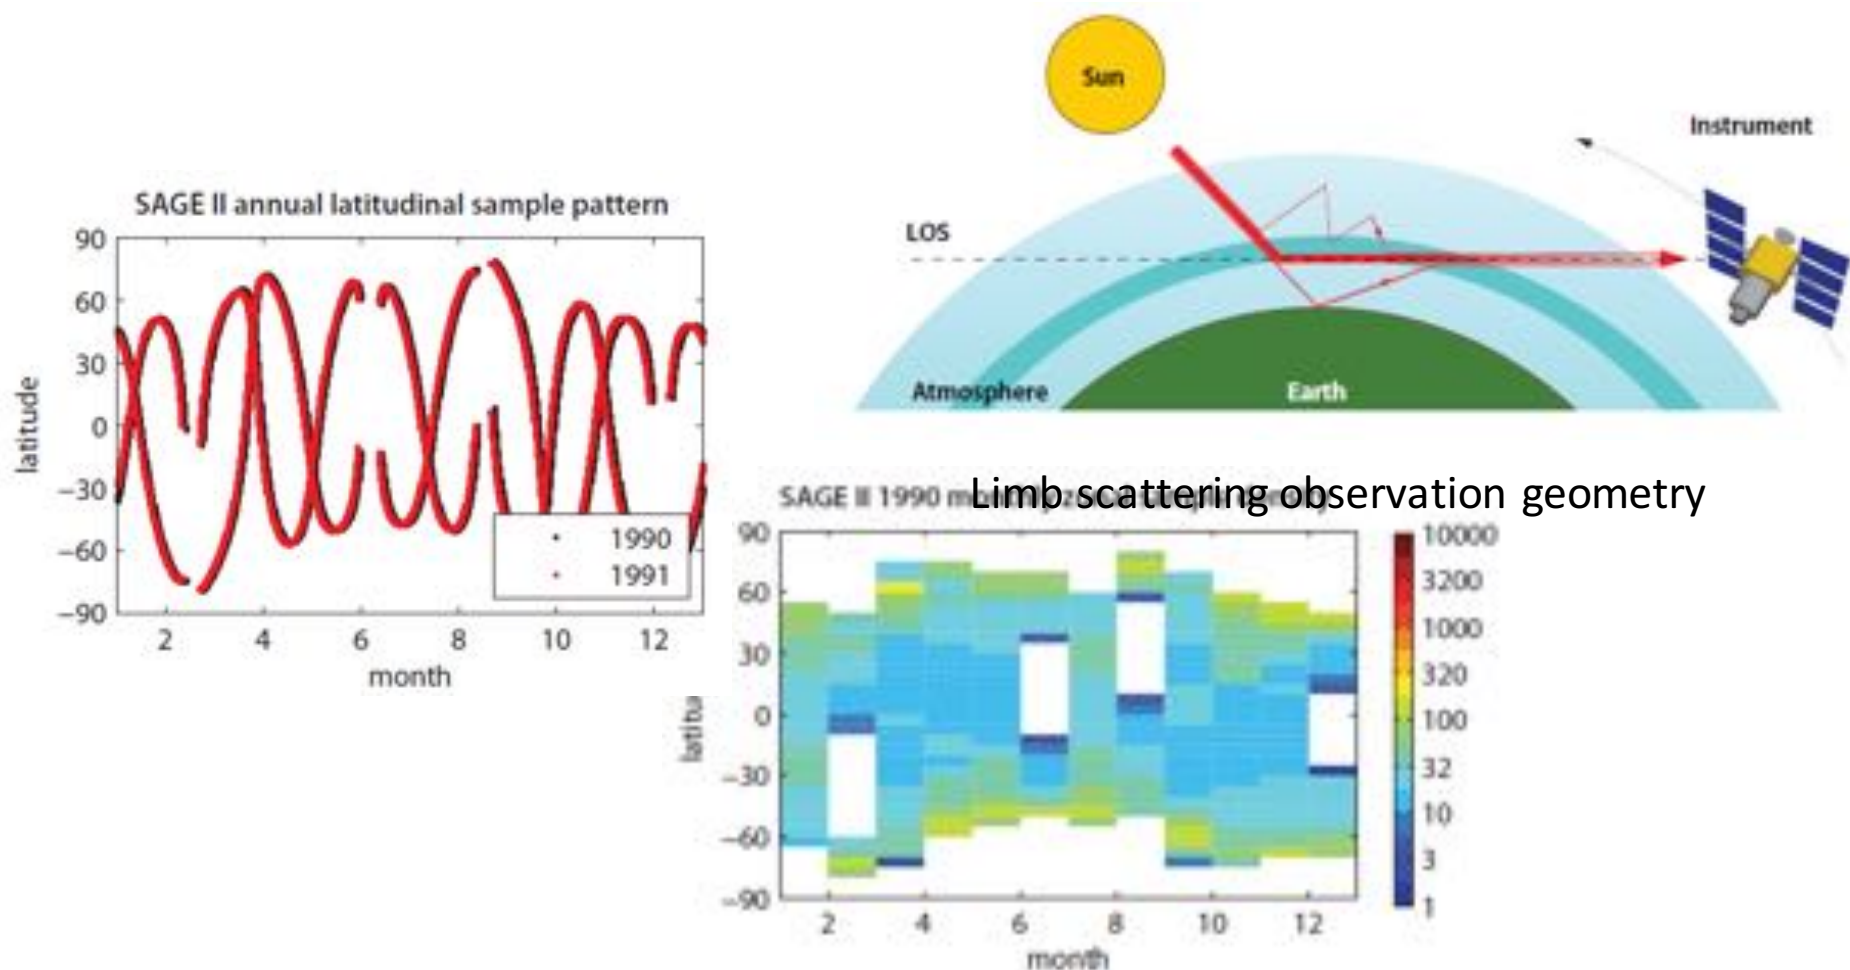

WCRP-01/2015

ICSU
International Council for Science

Chapter 2 - Satellite instruments and data sets

- Satellite measurement techniques (observation geometry, wavelengths, orbits)

Chapter 3 - Climatology framework

- Climatology construction (methodology, local time scaling, instrument-specific information)

| Instrument | Latitudinal coverage | LT at equator ¹ | LT of measurement ² | Inc. ³ | Vert. Grid ⁴ | Alternate grid ⁵ | Meas. ⁶ | Conversion to VMR ⁷ | Data density per day |
|------------------|--|----------------------------|--------------------------------|-------------------|-------------------------|-----------------------------|--------------------|--------------------------------|------------------------------|
| LIMS on Nimbus 7 | 64°S–84°N (daily) | a: 11:51 am d: 11:51 pm | a: 1 pm d: 11 pm | 99.3° | p | N/A | VMR | N/A | 3000 |
| SAGE I on AEM-B | 75°S–75°N (~one month) | N/A | N/A | 56° | z | NCEP | ND | NCEP | 30 |
| SAGE II on ERBS | 75°S–75°N (~one month) | N/A | N/A | 57° | z | NCEP | ND | NCEP | 30 |
| OSIRIS on Odin | 82°S–82°N (daily, no winter hemisphere) | a: 6:30 pm d: 6:30 am | a: 6:30 pm d: 6:30 am | 97.8° | z | ECMWF operational analysis | ND | ECMWF operational analysis | 300 - 975 |
| SMR on Odin | 83°S–83°N (daily) | a: 6:30 pm d: 6:30 am | a: 6:30 pm d: 6:30 am | 97.8° | p | N/A ⁸ | VMR | N/A | 600-975 |
| GOMOS on Envisat | 90°S–90°N (daily, no summer poles for night) | a: 10:00 pm d: 10:00 am | a: 10-12 pm d: 8-10.30 am | 98.55° | z | ECMWF operational analysis | ND | ECMWF operational analysis | 100-300 (night measurements) |
| MIPAS | 90°S–90°N | a: 10:00 pm | a: 10:00 pm | 98.55° | z | MIPAS | VMR | N/A | 1000 / 1300 |

- Climatology uncertainties and diagnostics

‘Climatological’ validation approach based on binned/interpolated datasets

Advantages

- Consistent between all instruments
- Avoids sensitivity to arbitrary coincidence criteria
- Larger sample sizes (minimize the random sampling error)

Disadvantages

- Biased mean values due to non-uniformity of sampling
- Different resolutions in altitude (averaging kernels)

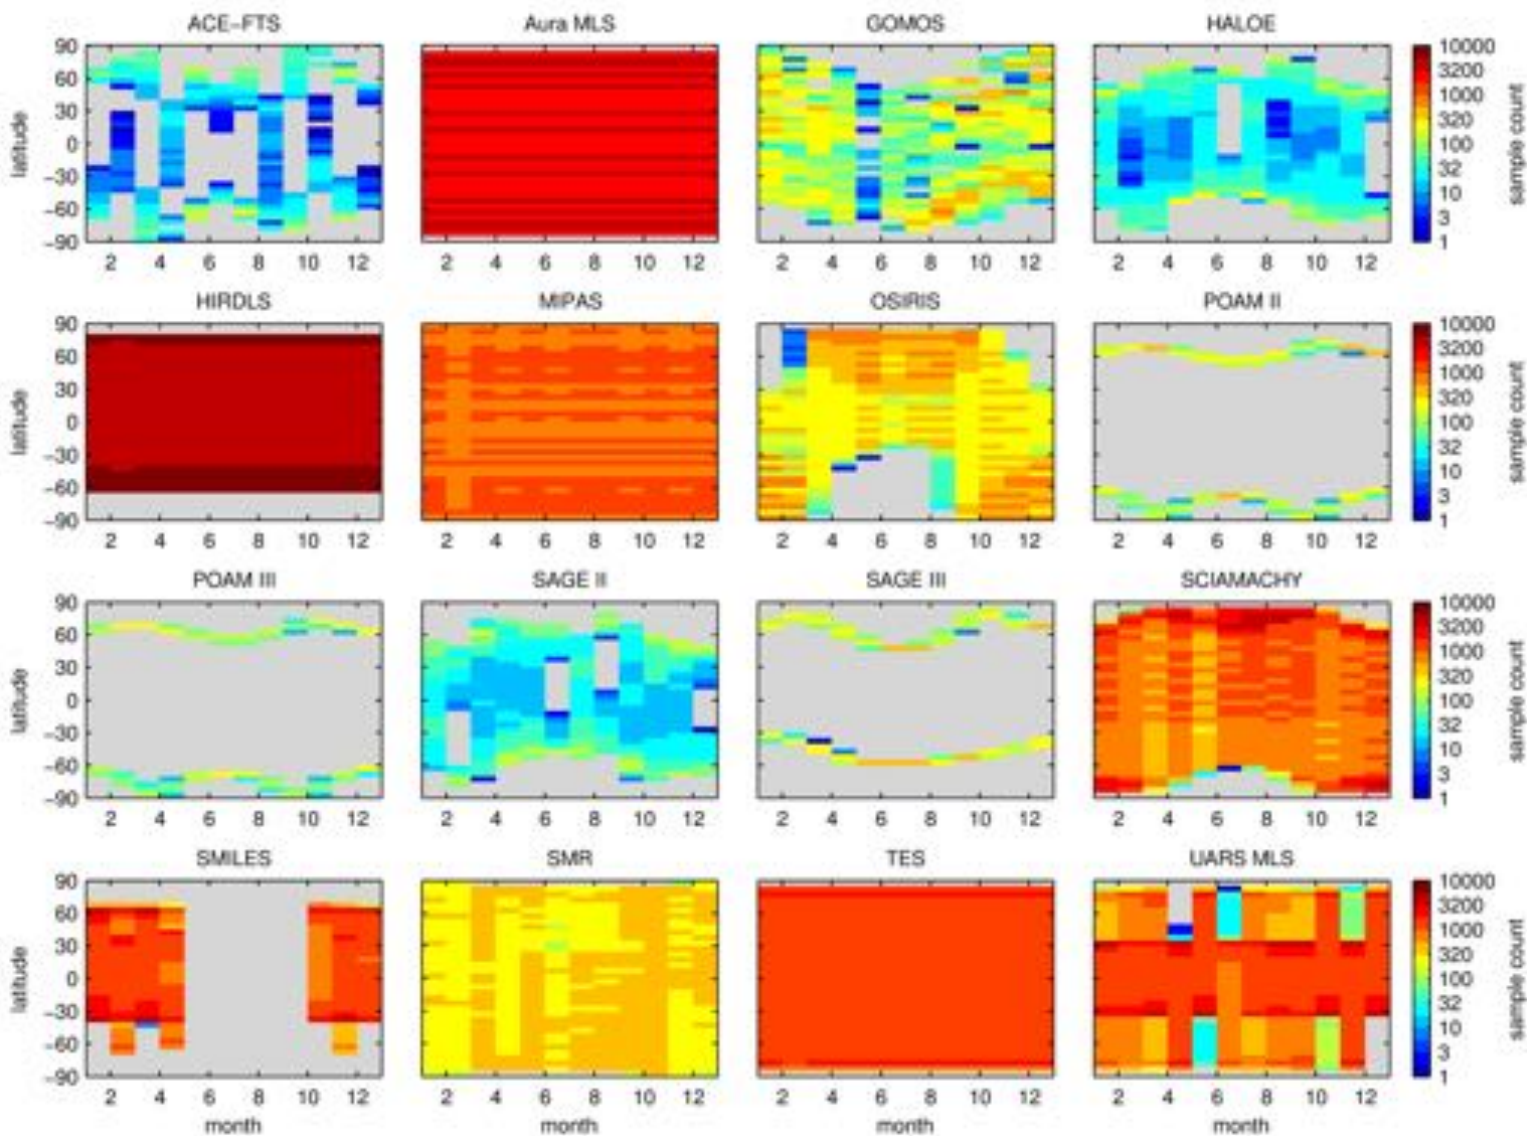

Evaluations

- Need for a reference that does not favor a certain instrument -> Use of the multi-instrument mean (MIM)
- But: MIM is not the best climatology available, can suffer from changes in time periods and set of available instruments

What can we learn from the SPARC Data Initiative?

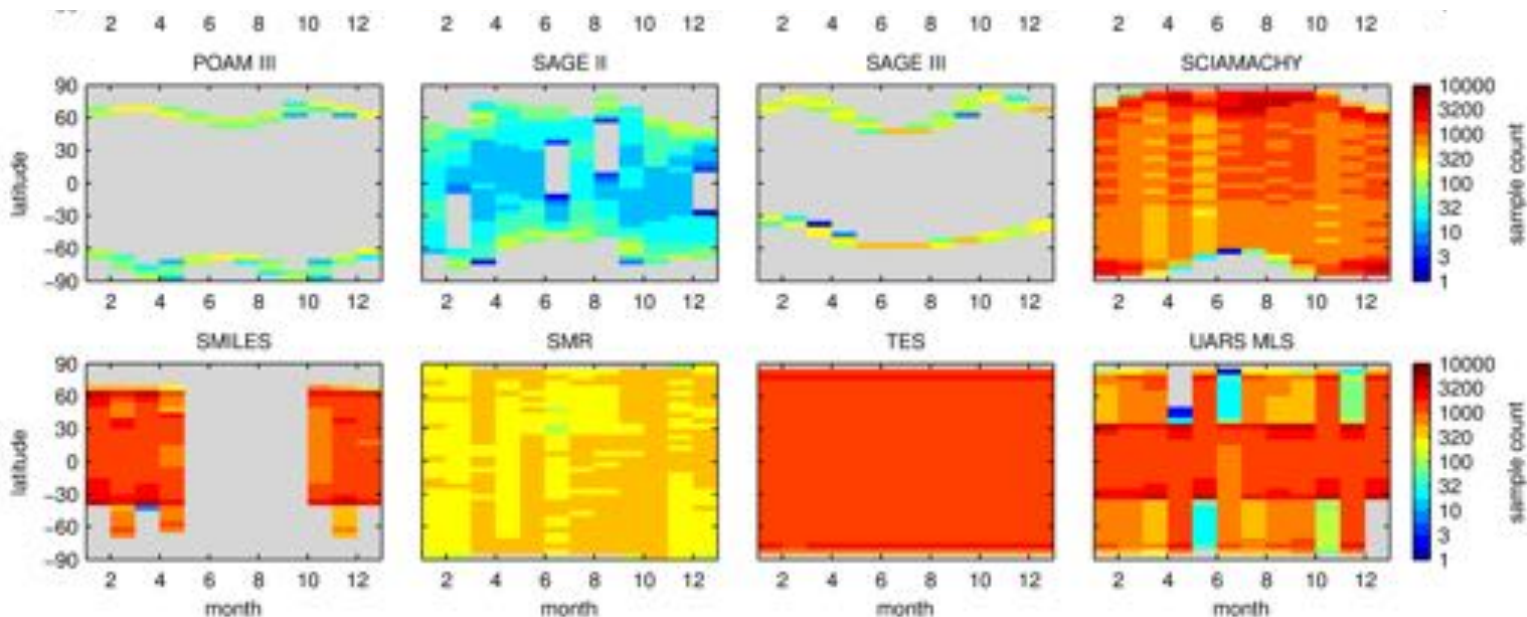

- 1) Sampling Bias Study**
- 2) Study on the impact of the vertical resolution**
- 3) Uncertainty in our knowledge of the atmospheric mean state**
 - Based on diagnostics of monthly /annual zonal mean cross-sections
 - Mean spread between data sets over maximum number of years
- 4) Outliers and unphysical features**
 - Evaluation of variability and other physical features (e.g., seasonal cycle, QBO, tape recorder, Antarctic ozone , polar vortex dehydration, EPP NO_x)
- 5) Implications for model-measurement intercomparison**

Sampling patterns: sample counts

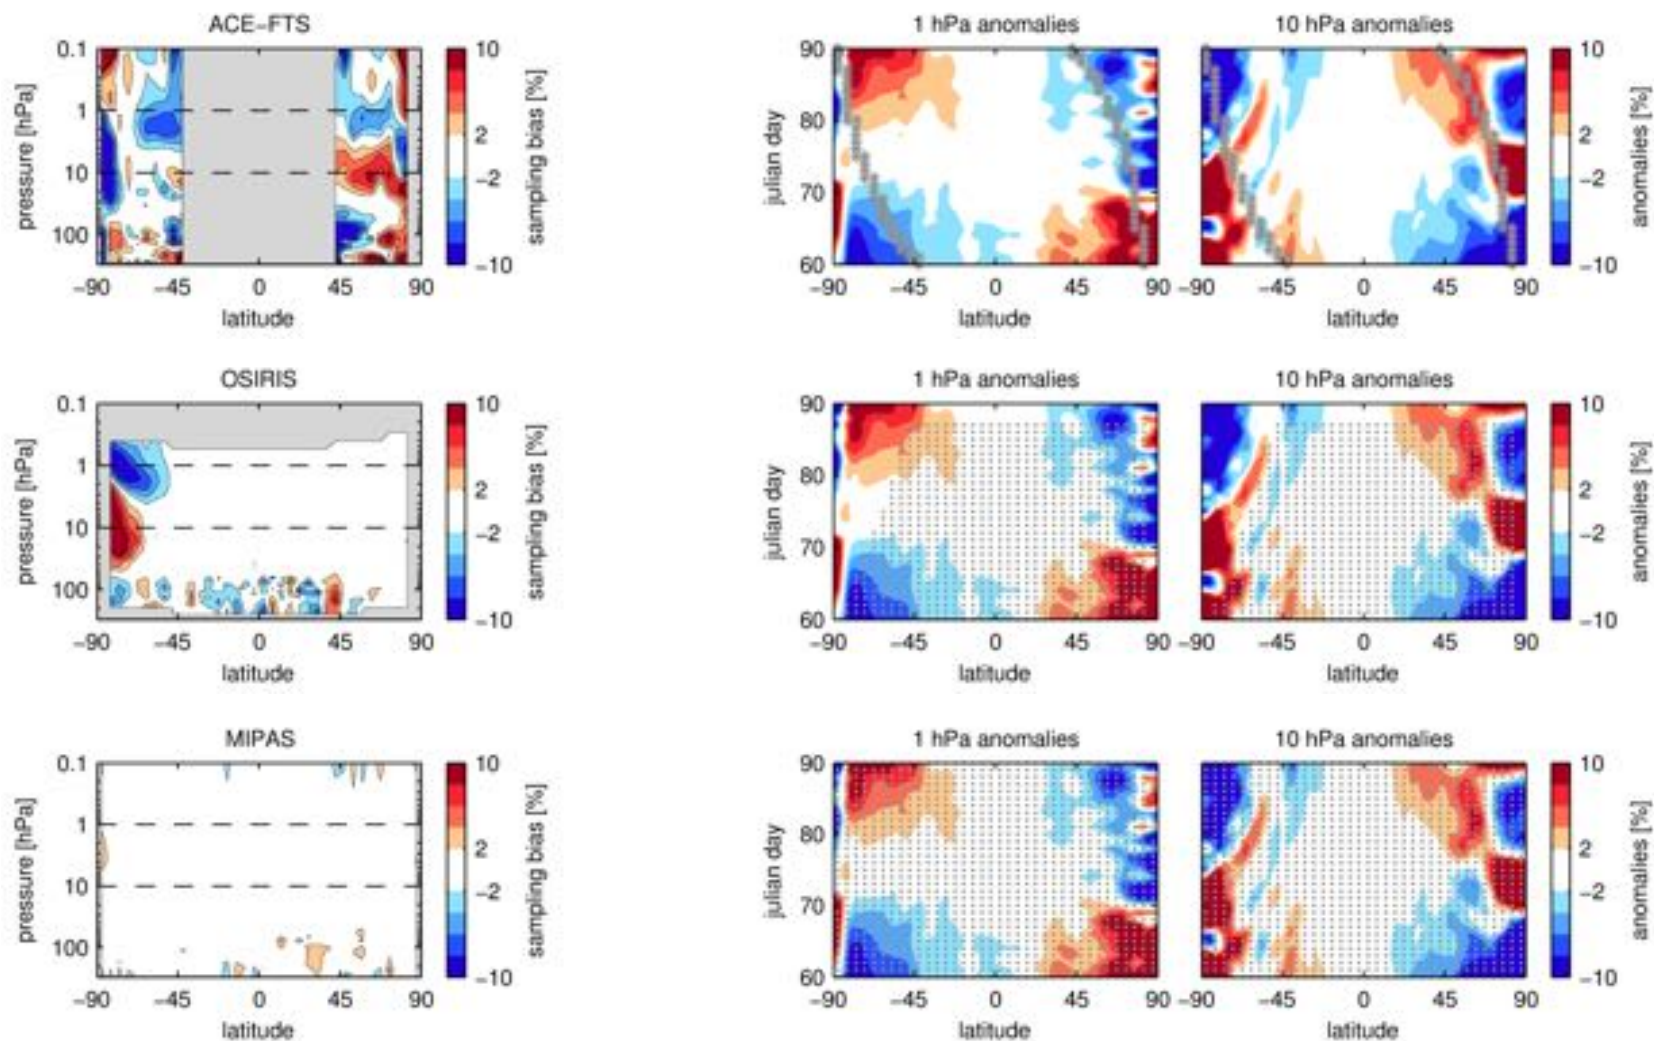

Sampling Bias Study

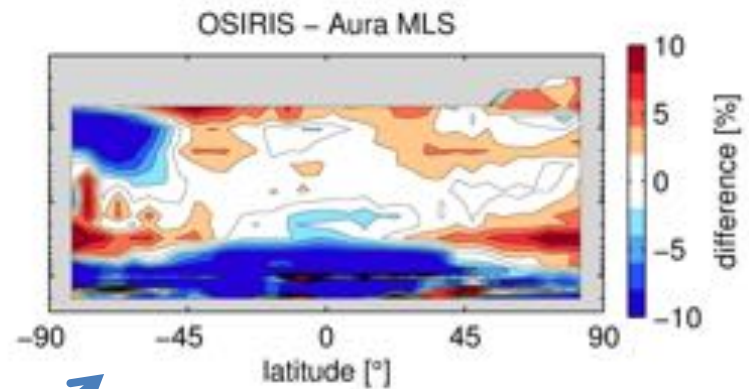

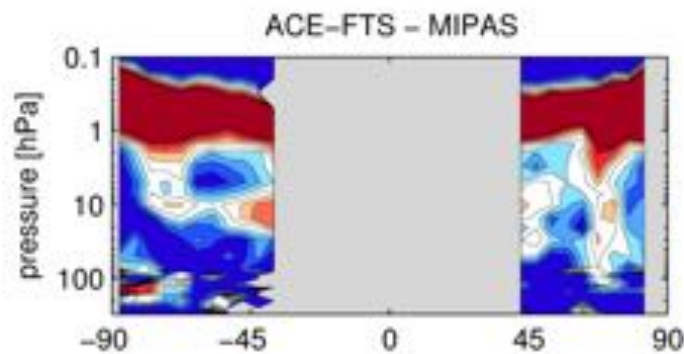

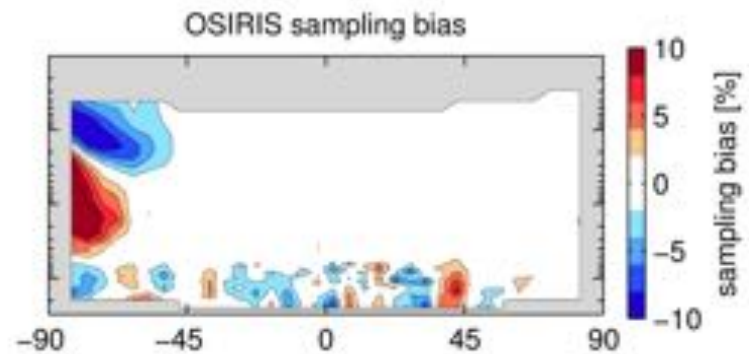

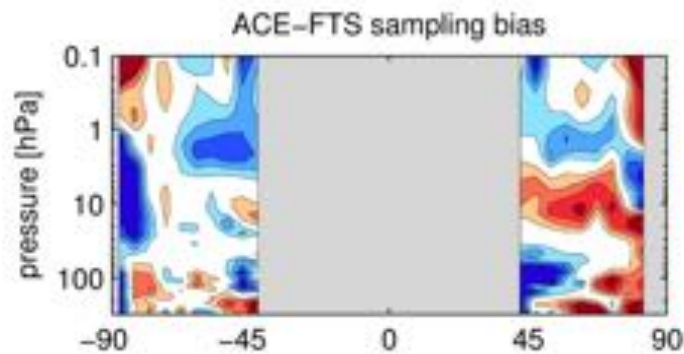

- Use chemical fields from a coupled chemistry model, (e.g., WACCM)
- Sample model fields based on space-time sampling patterns of specific instruments (*"satellite simulator"*)
- Difference of sample mean and population mean (with full resolution model fields) gives estimate of potential sample bias in climatologies.

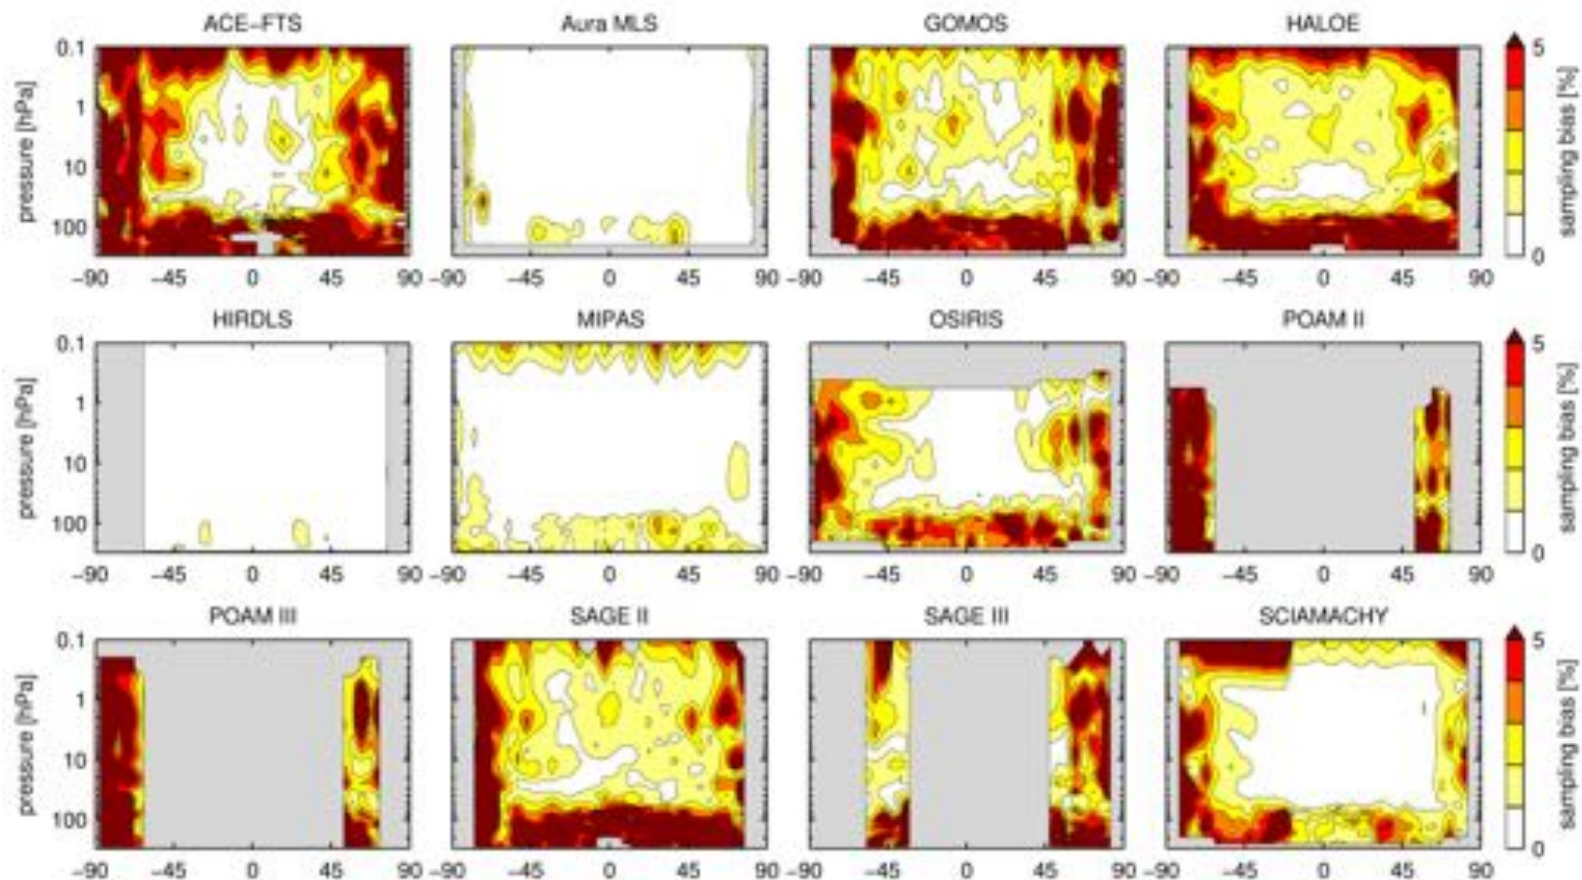

March O₃ case study: impact of temporal non-uniformity

March O₃ Case study: reality check

Real SPARC DI data!

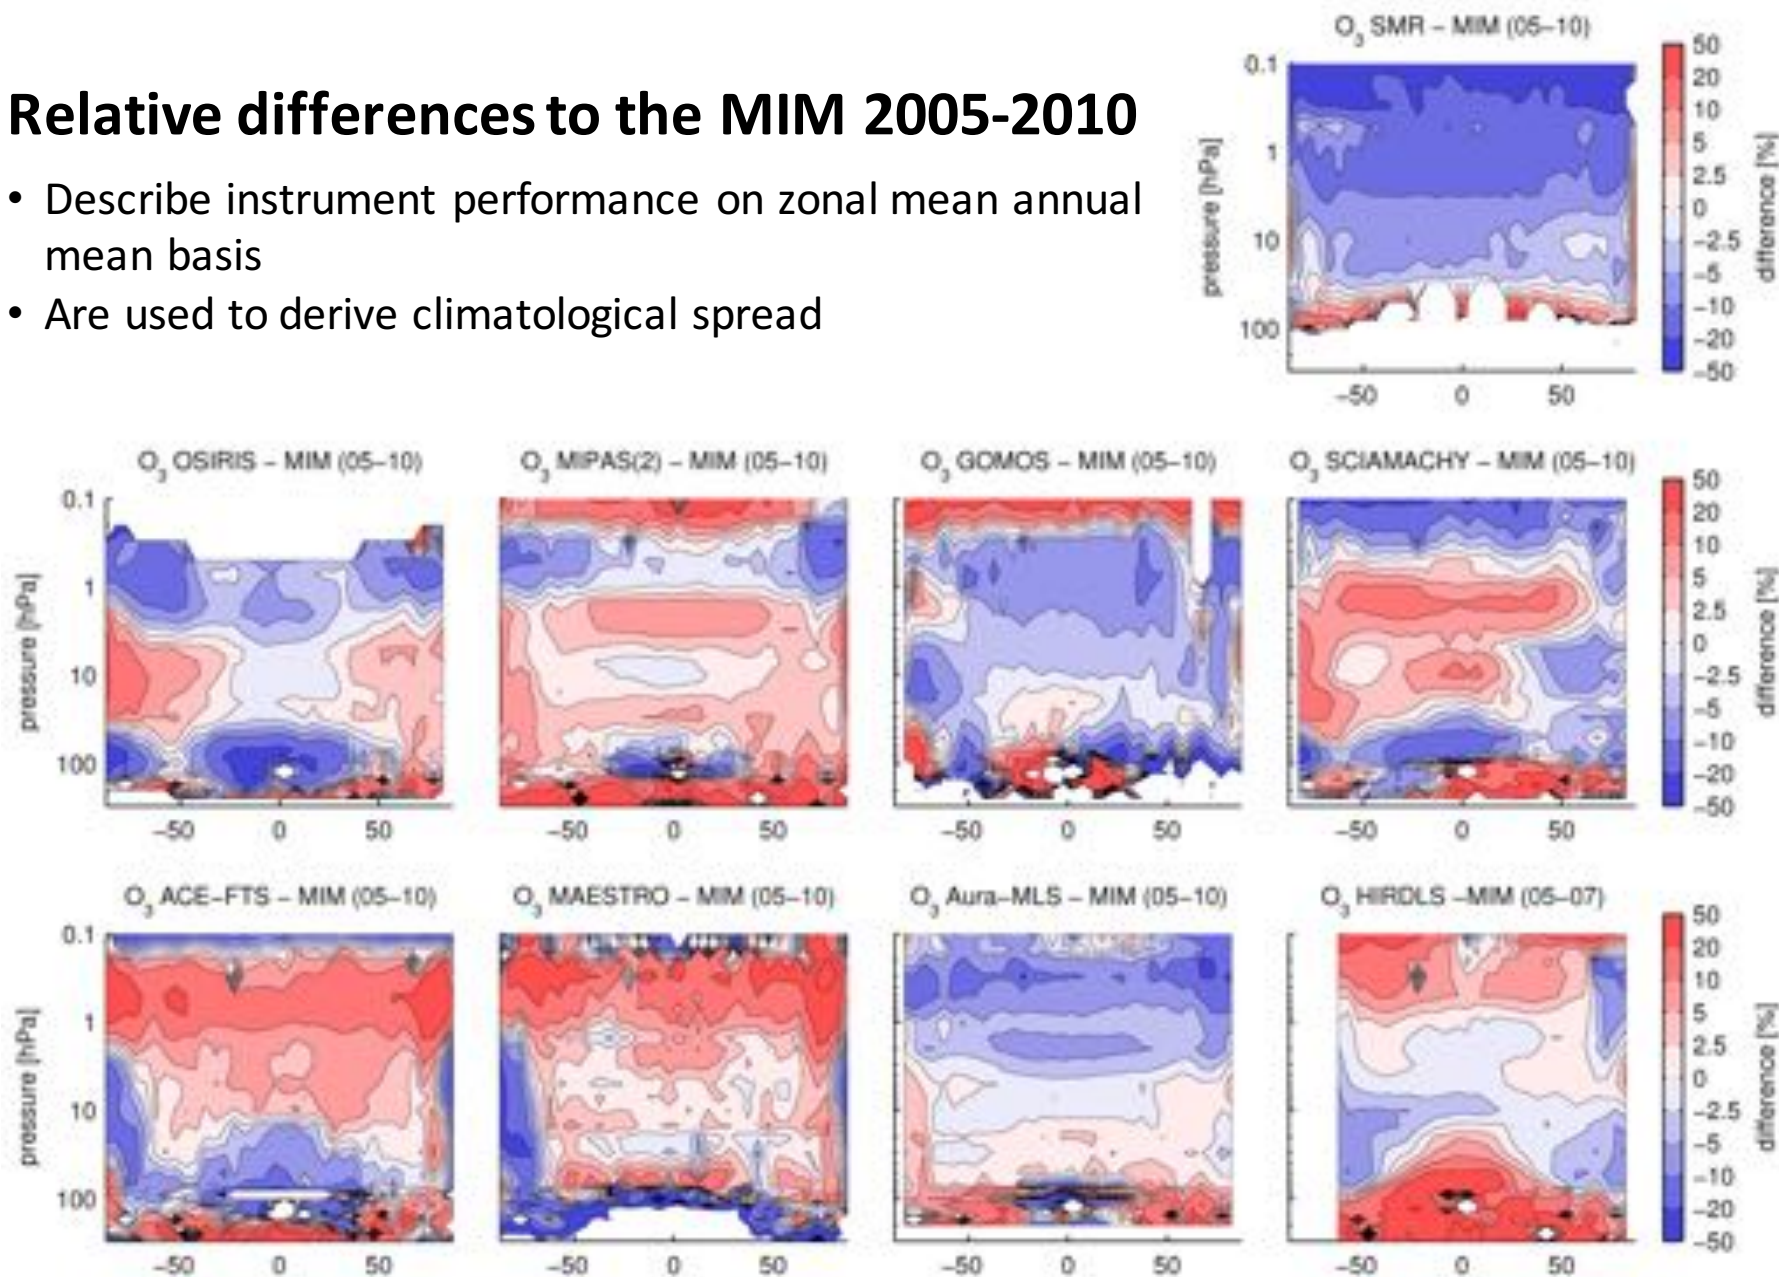

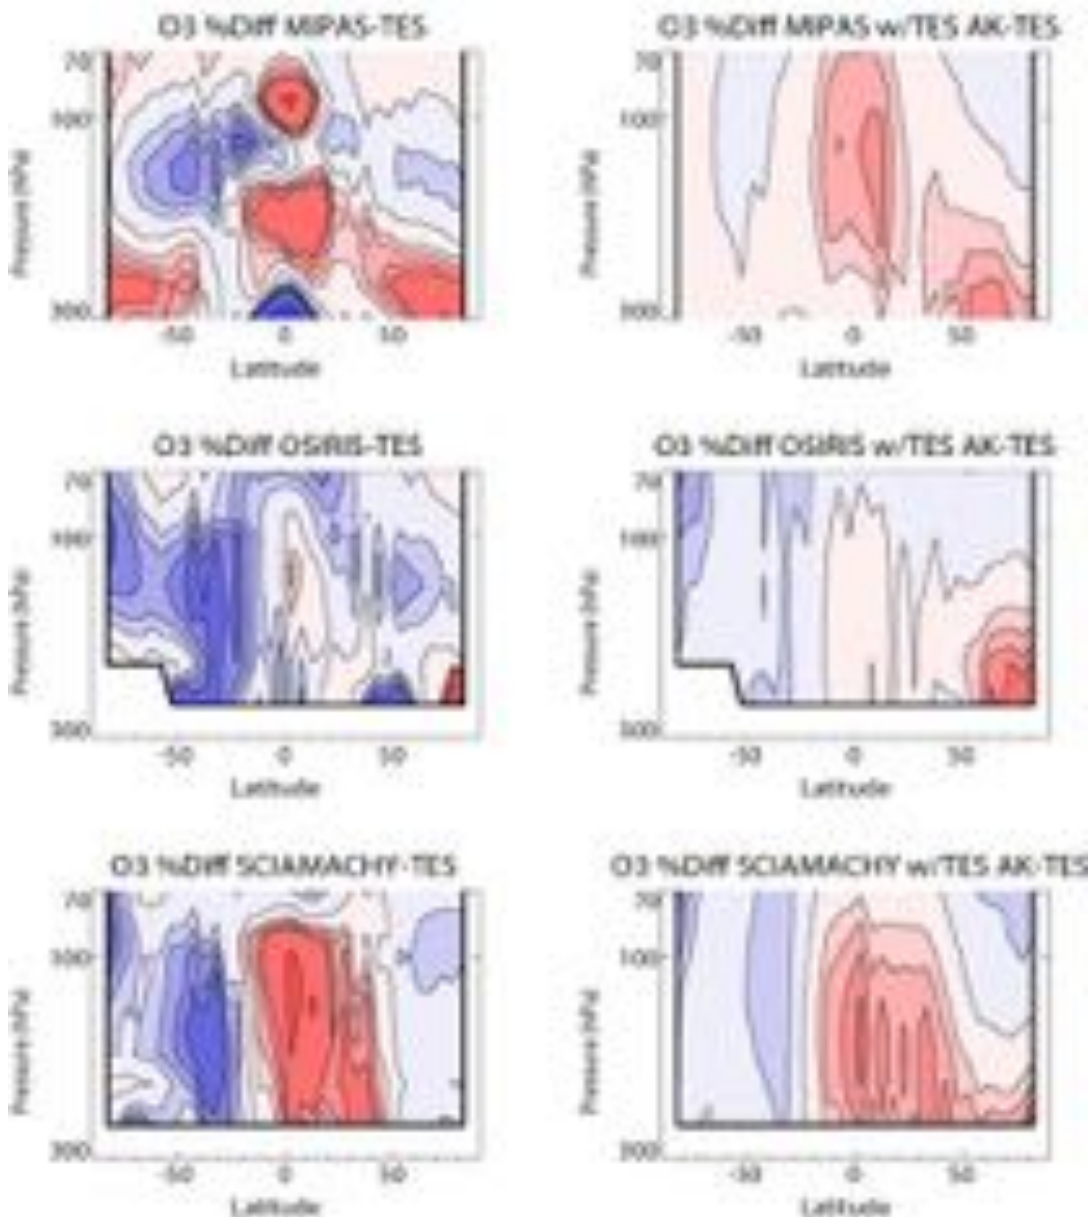

Toohey et al., 2013

- Instruments with regular and uniform sampling patterns -> small sampling bias
- Instruments with varying latitudinal coverage -> strong sampling biases for certain months and locations
- Sampling biases for O₃ can be $\geq 10\%$ (non-uniformity in day-of-month sampling)

Relative differences to the MIM 2005-2010

- Describe instrument performance on zonal mean annual mean basis
- Are used to derive climatological spread

Application of TES observational operator to limb-viewing instruments

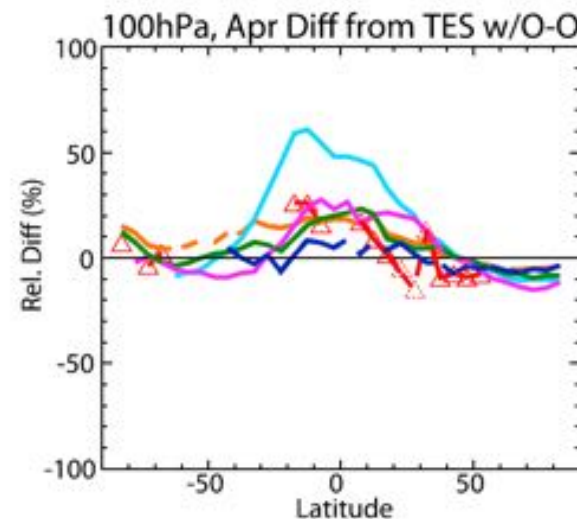

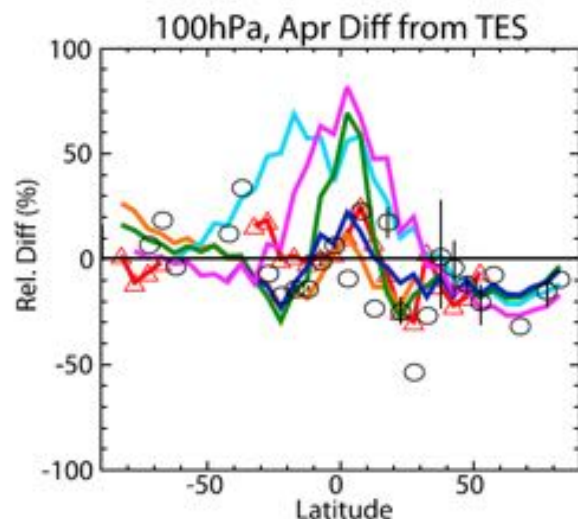

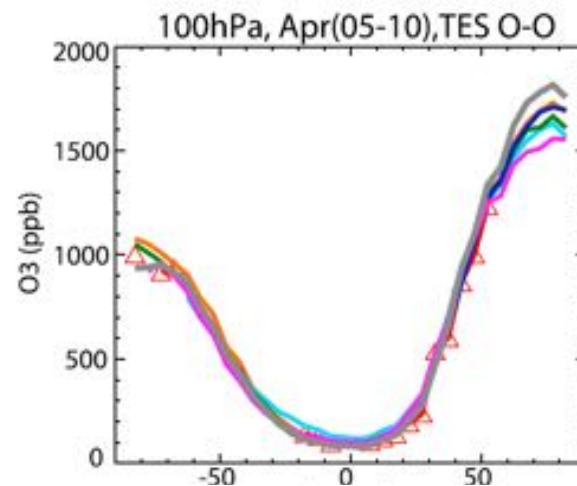

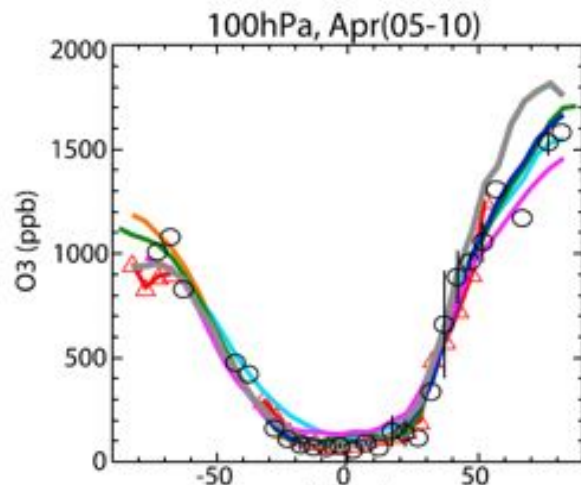

- Minimizes impact of vertical resolution
- Allows for identification of systematic difference e.g., positive bias of most instruments in tropical LS

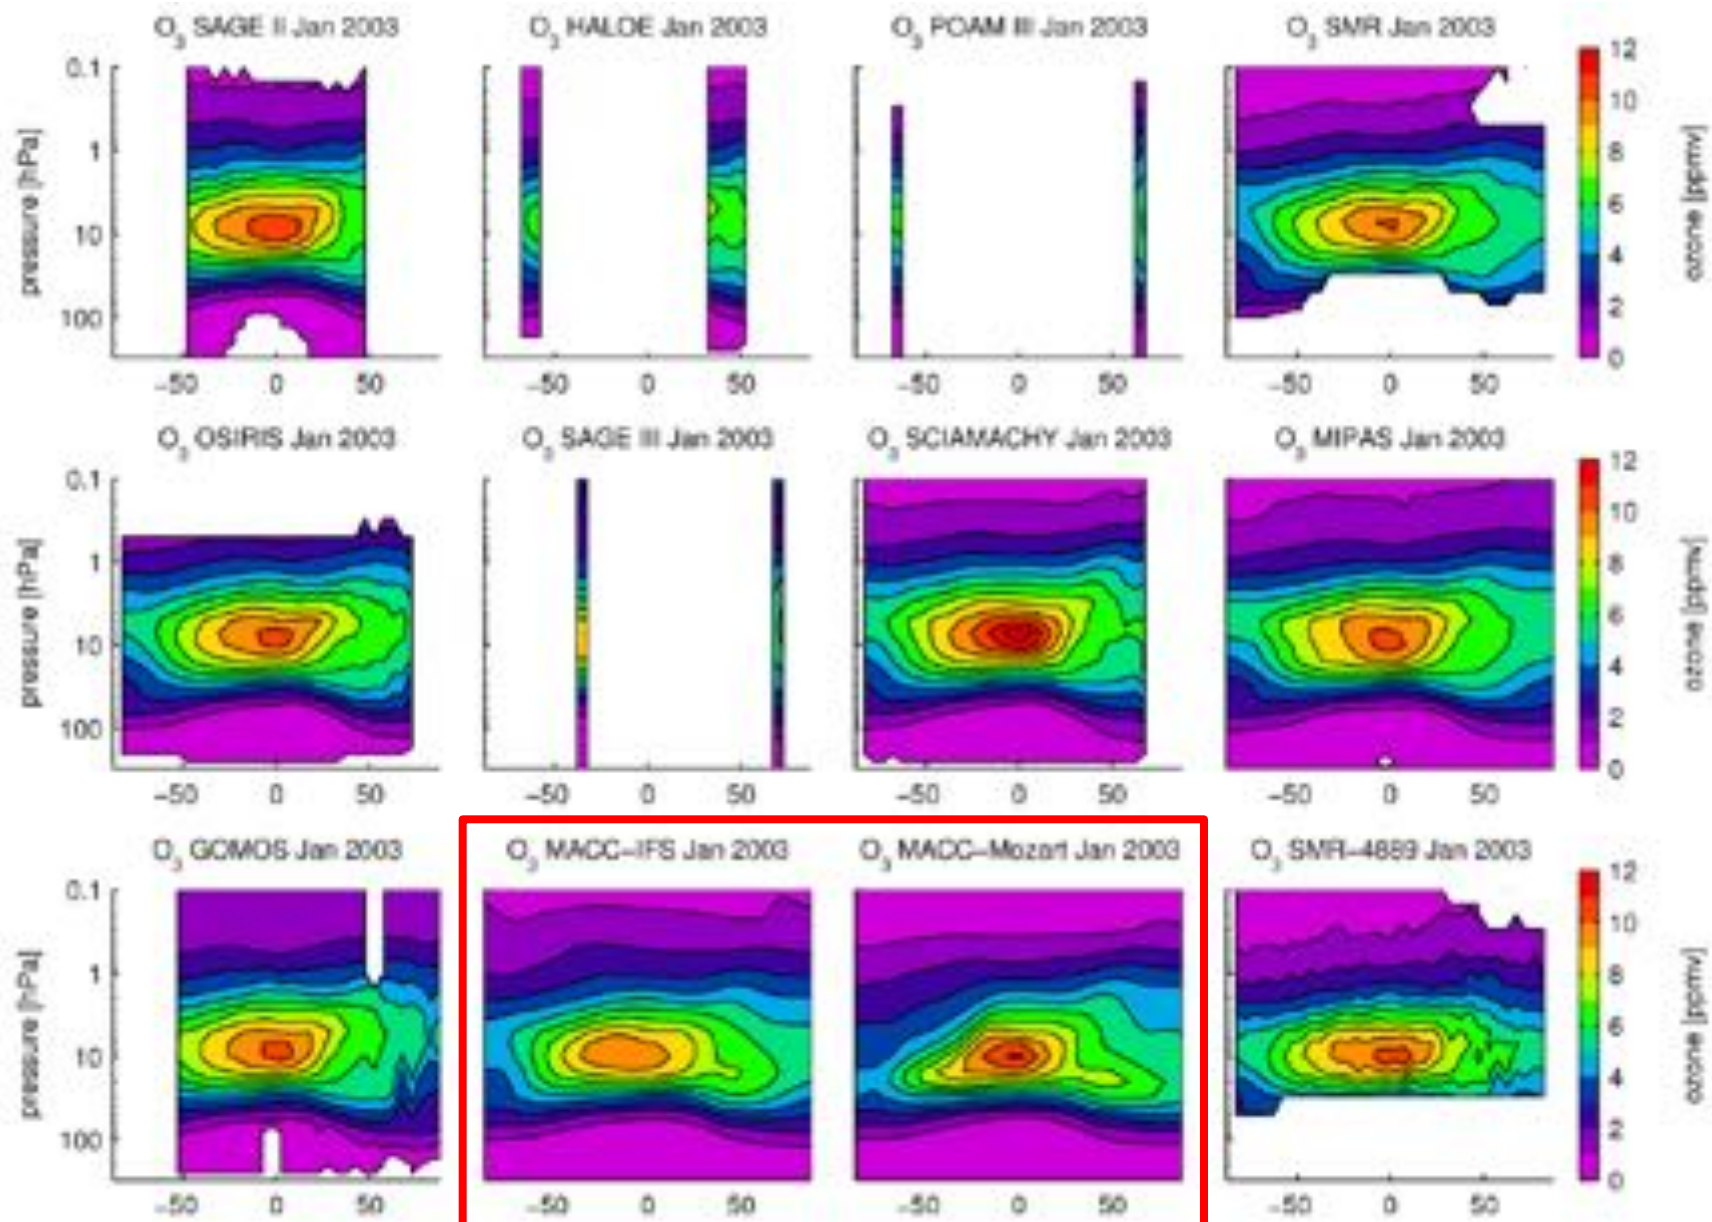

Impact of vertical resolution

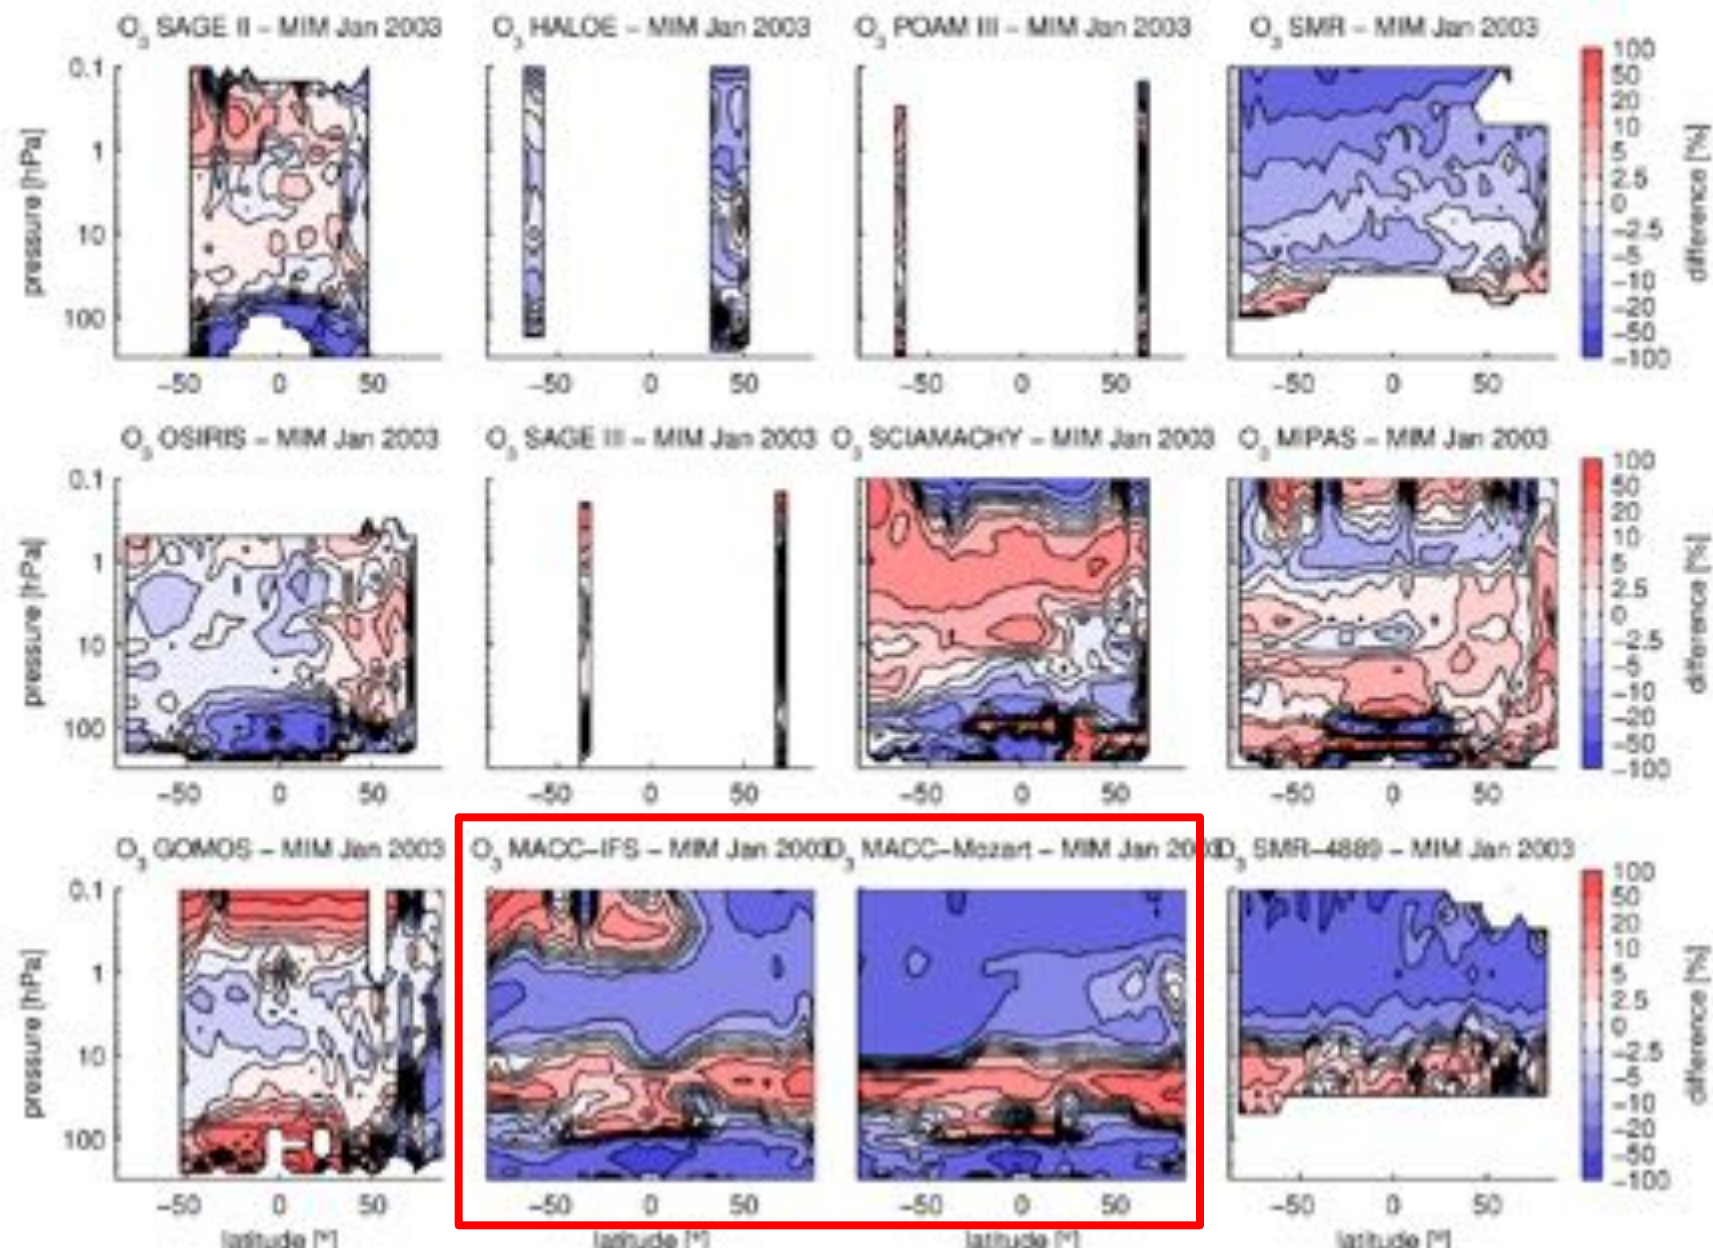

Application of TES observational operator to limb-viewing instruments

- Allows for identification of systematic difference e.g., positive bias of most instruments in tropical LS with respect to TES and ozone sondes

—△— ACE-FTS
— Aura-MLS
— HIRDLS
— MIPAS
— OSIRIS
— SCIAMACHY
— TES

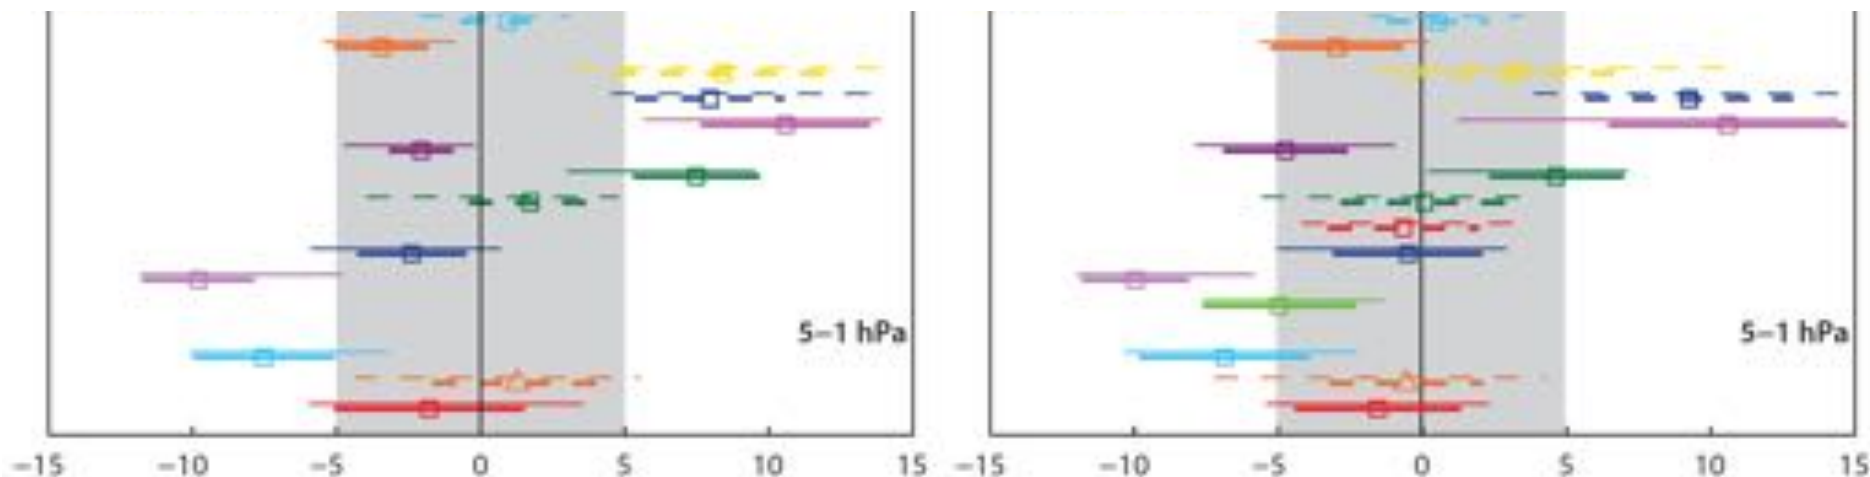

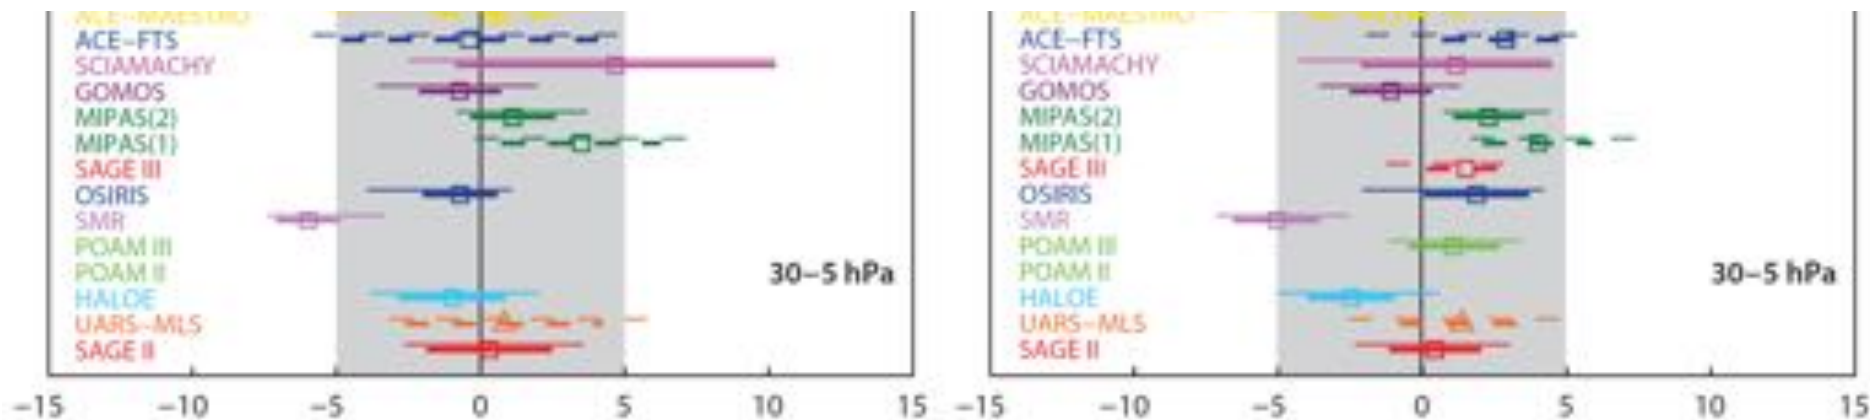

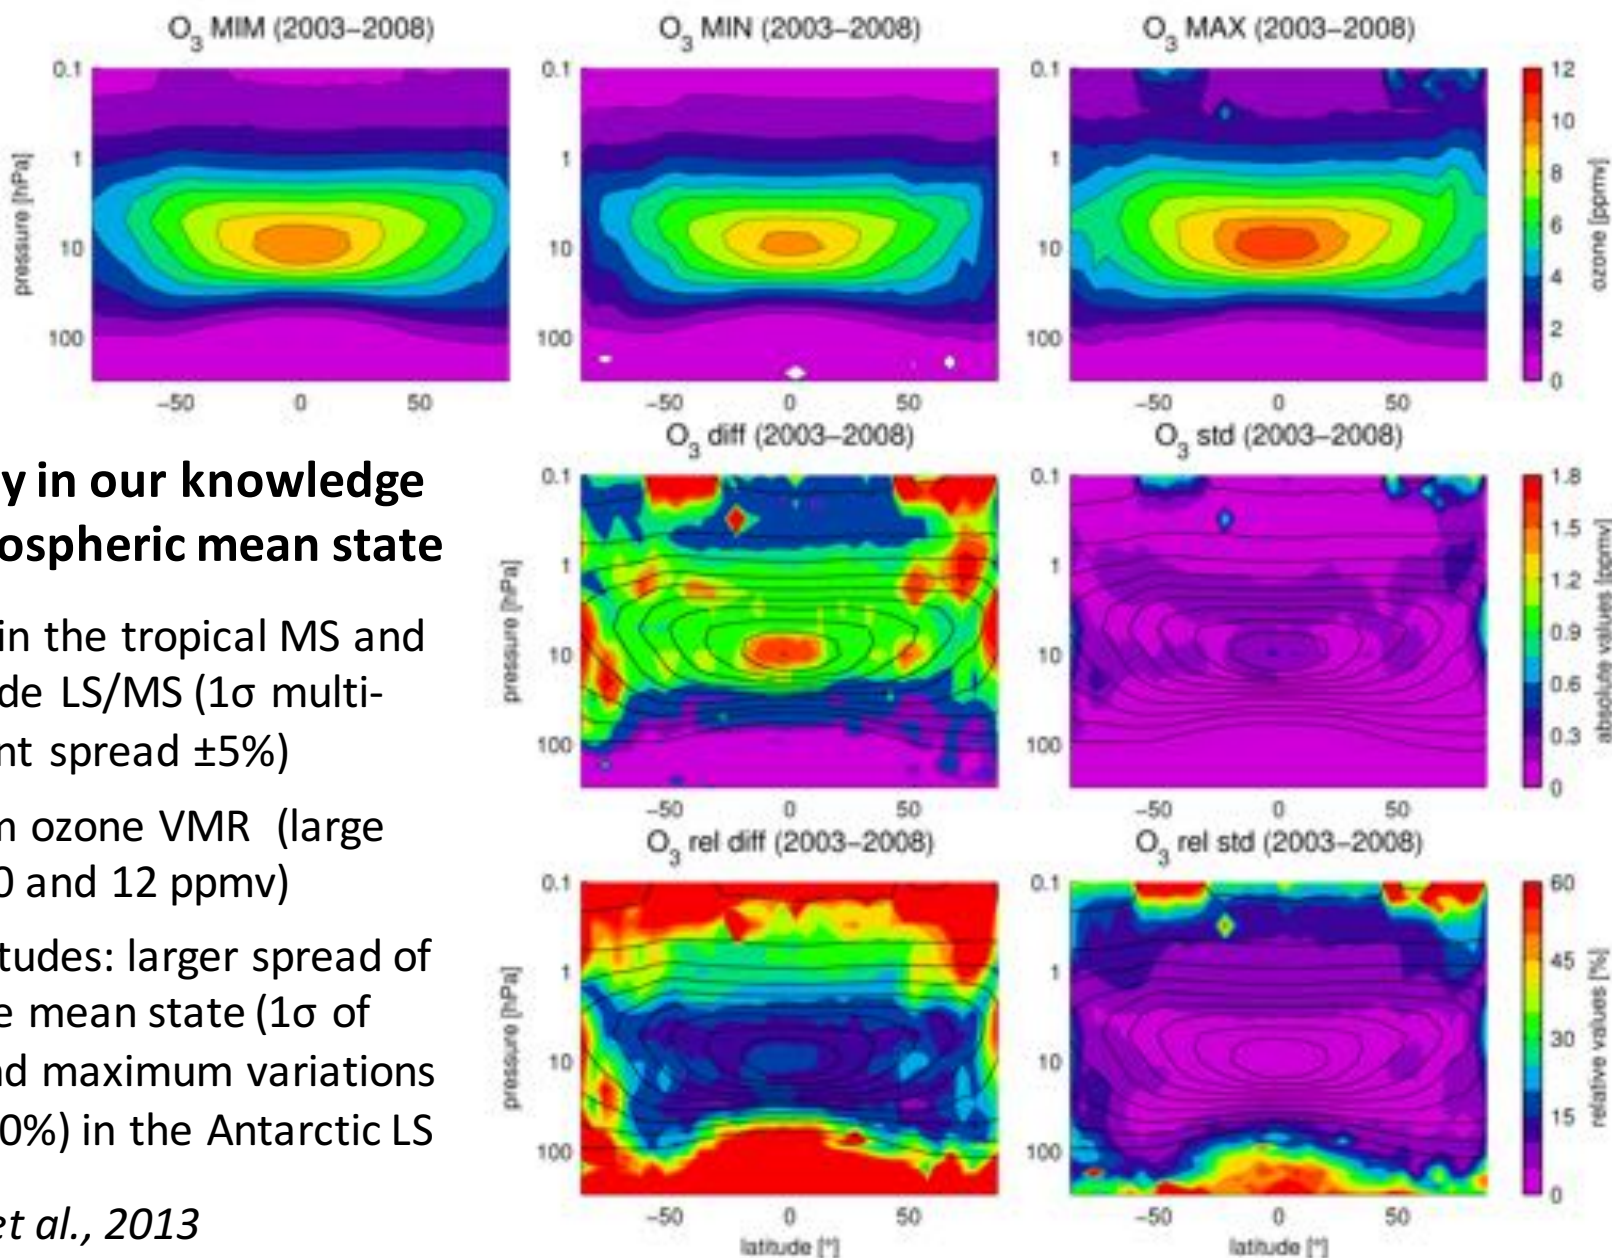

Evaluation of 18 ozone profile data sets [relative differences %]

Upper stratosphere (5-1 hPa) - Good agreement: $\pm 5\%$ to $\pm 10\%$.

Middle stratosphere (30-5 hPa) - Lowest spread between the instrument data sets: $\pm 5\%$

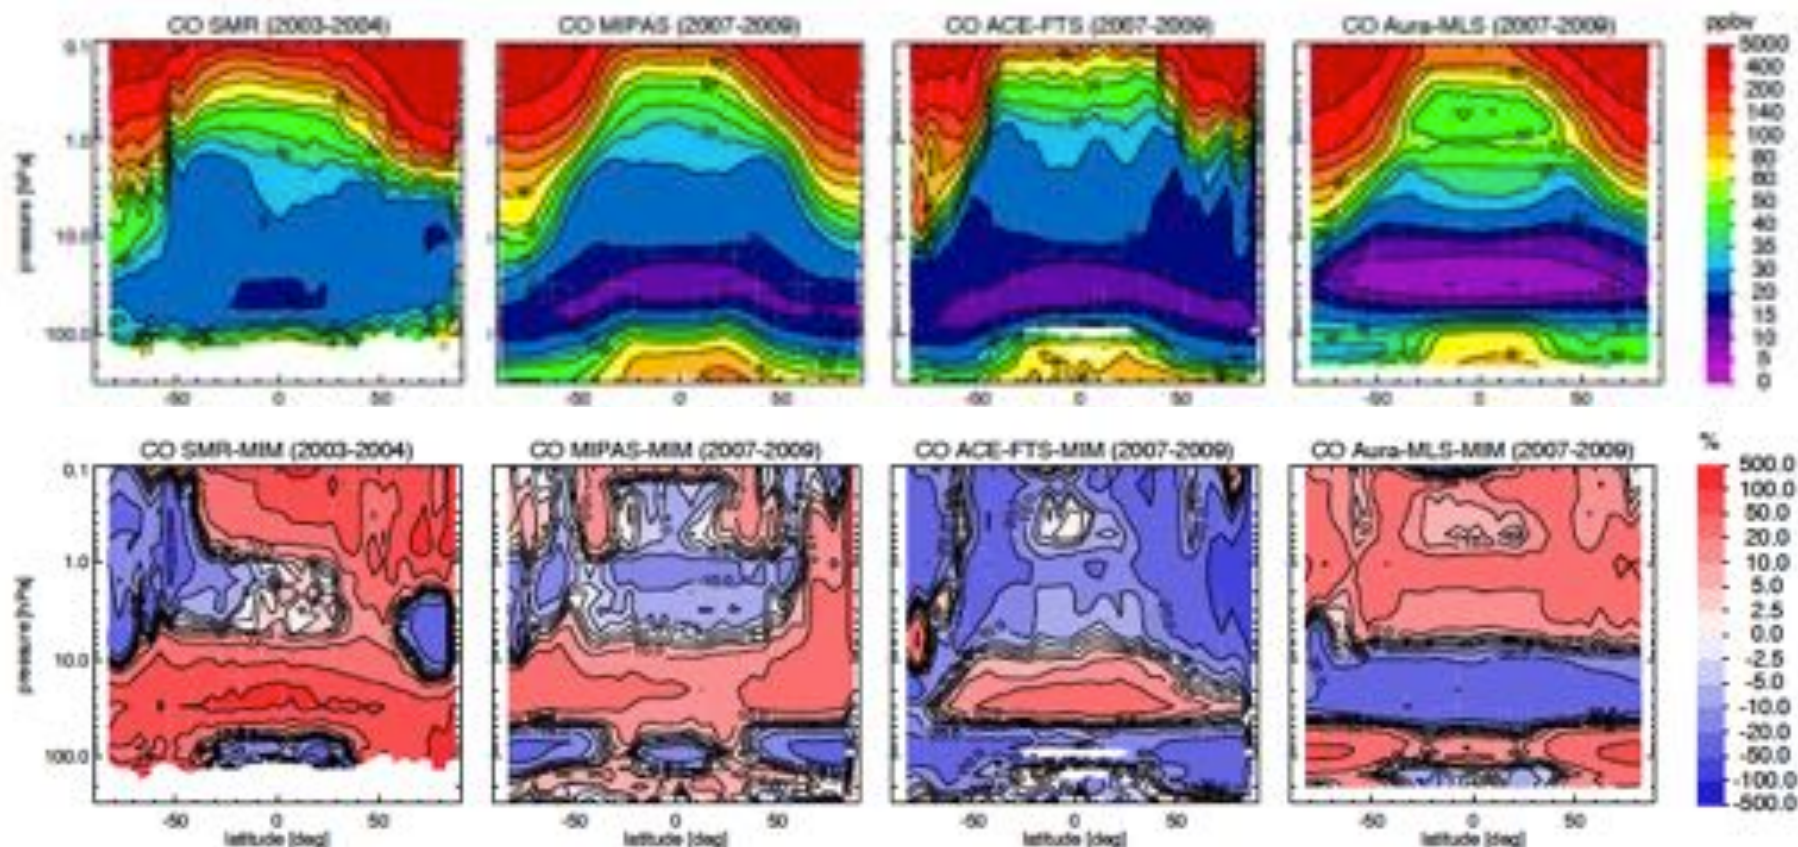

Uncertainty in our knowledge of the atmospheric mean state

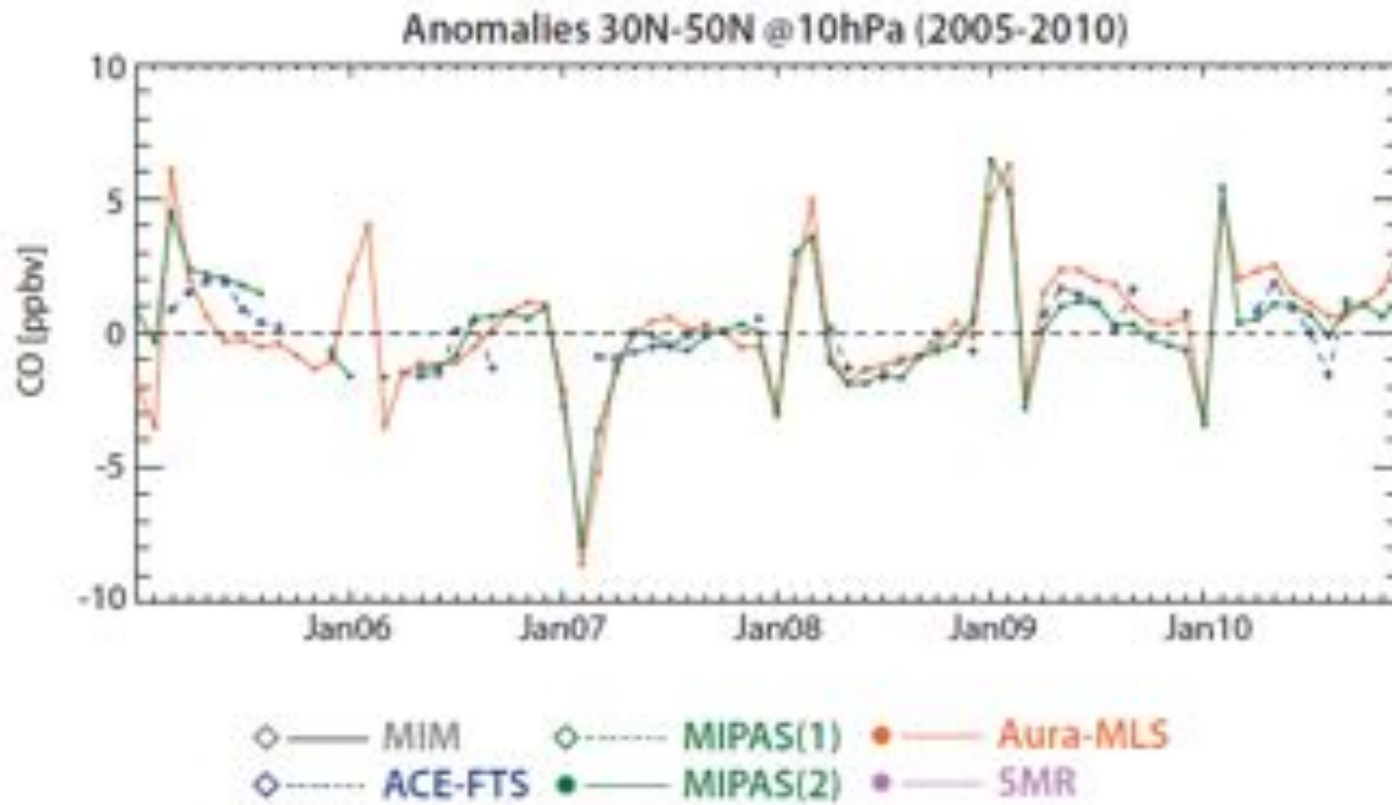

- Smallest in the tropical MS and midlatitude LS/MS (1 σ multi-instrument spread $\pm 5\%$)
- Maximum ozone VMR (large spread 10 and 12 ppmv)
- Polar latitudes: larger spread of the ozone mean state (1 σ of $\pm 15\%$) and maximum variations (1 σ of $\pm 30\%$) in the Antarctic LS

CO annual zonal mean cross sections

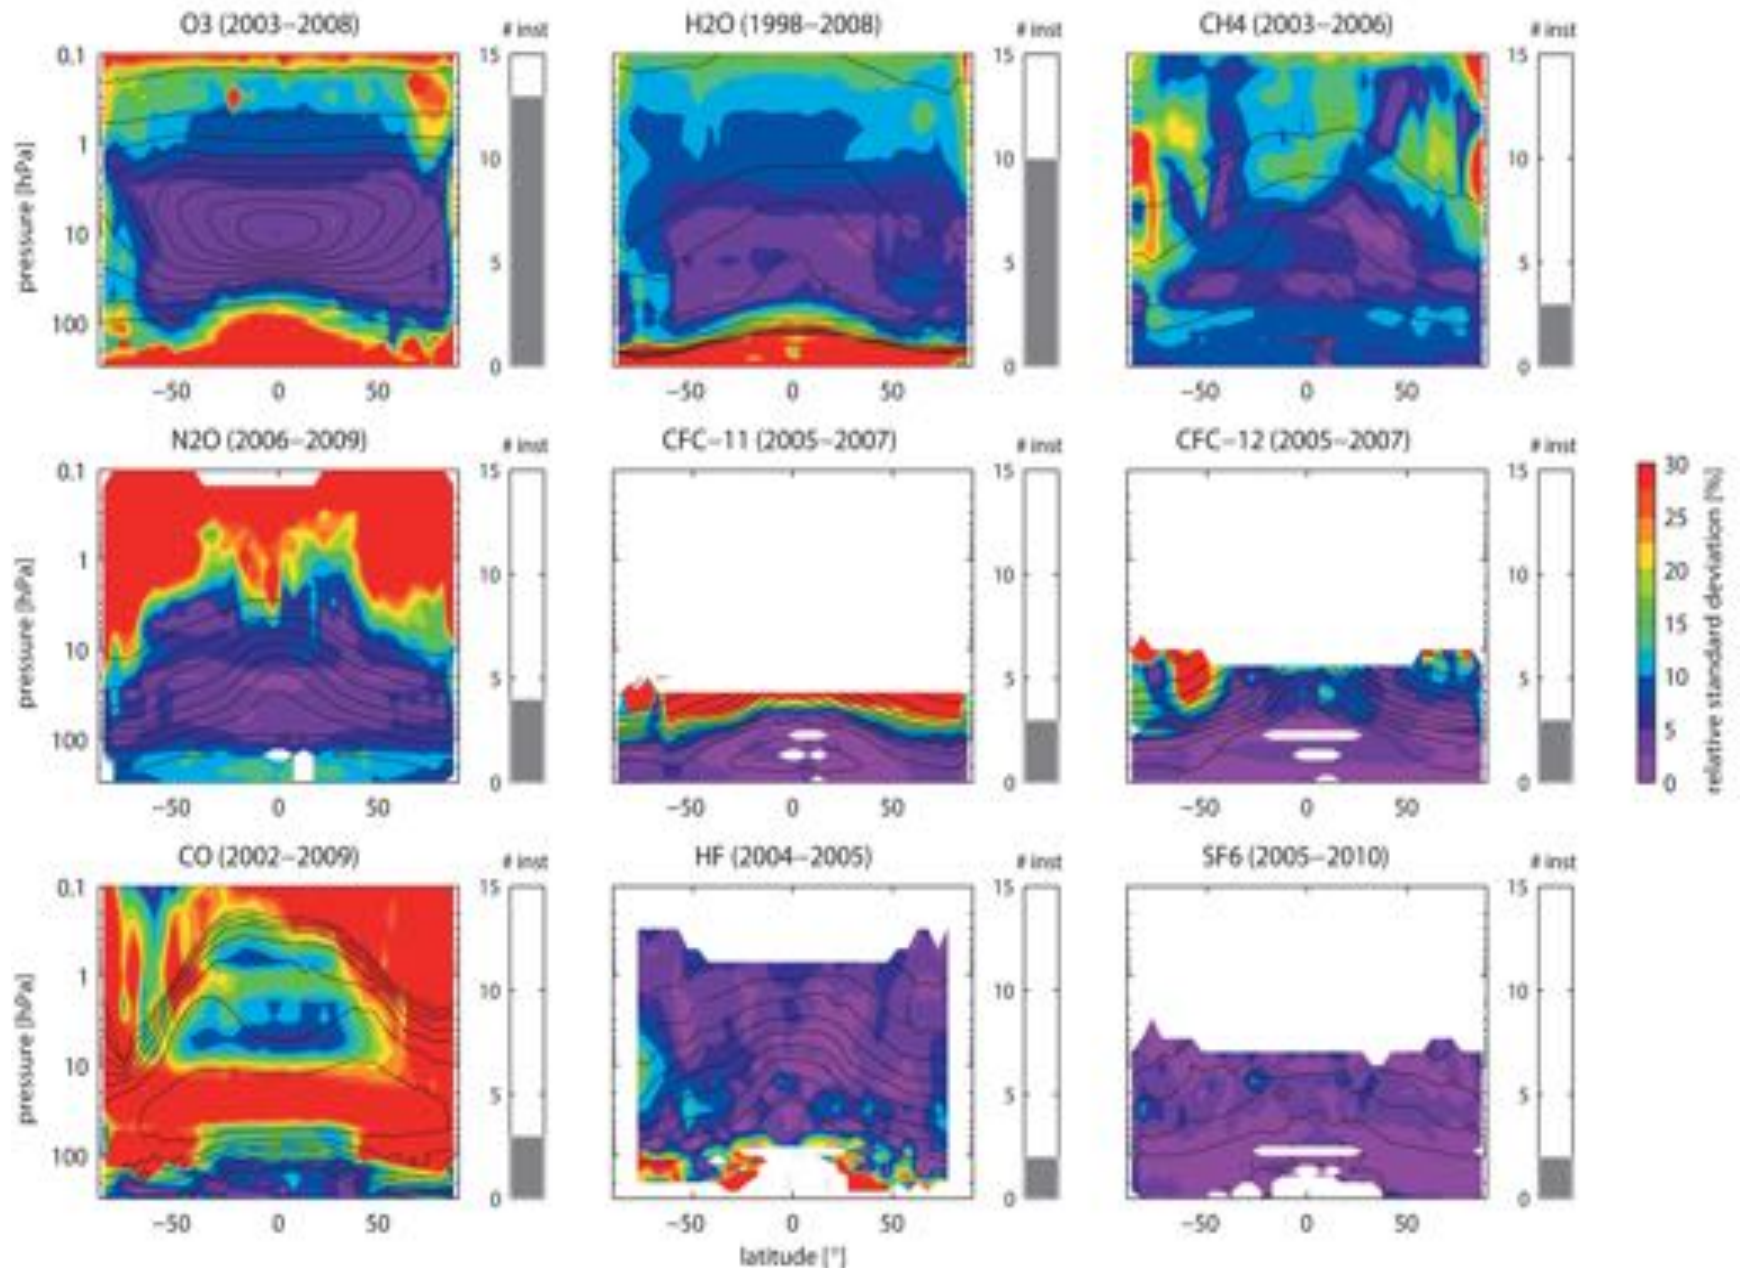

- Large differences exist in some of the species in the annual zonal means. Further retrieval studies are suggested to get at the cause of this discrepancy.

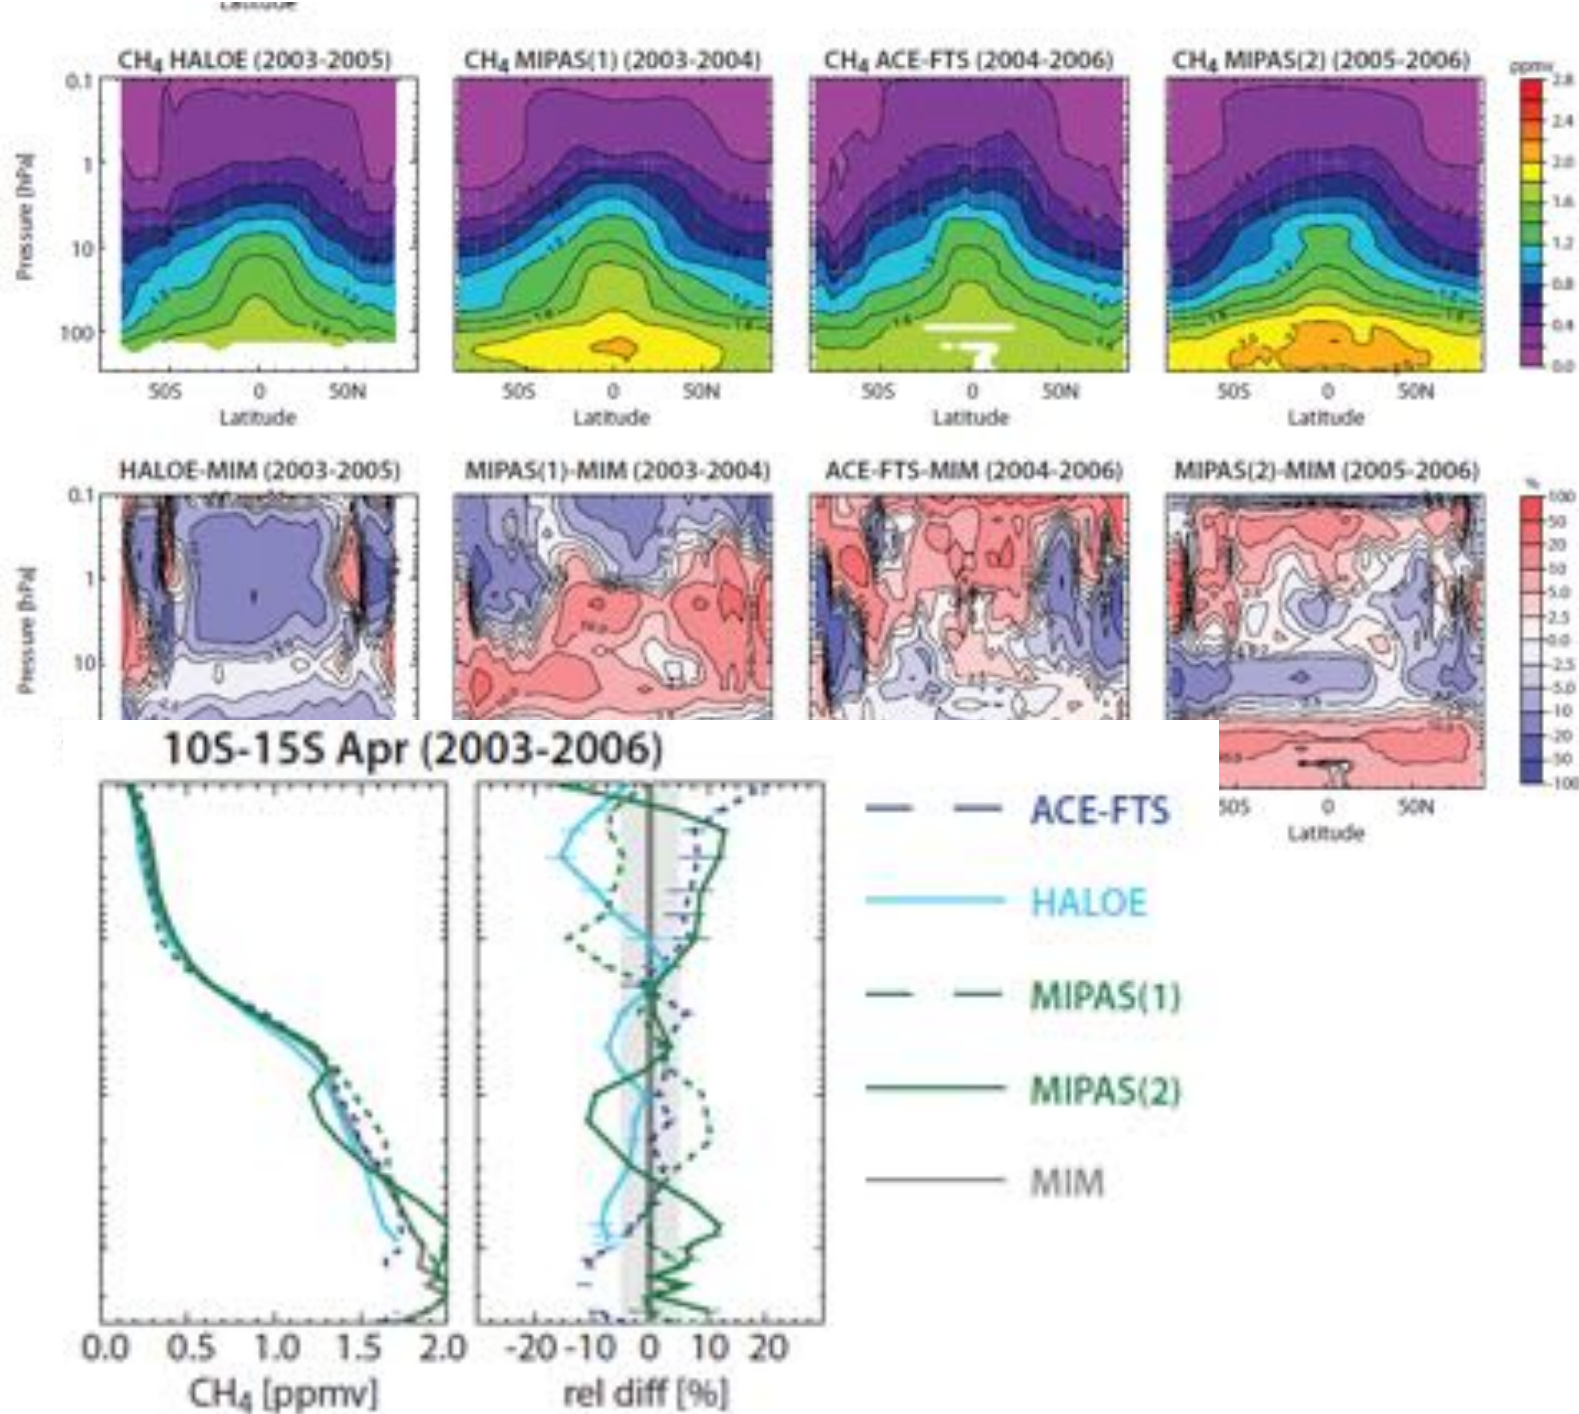

CO annual zonal mean cross sections

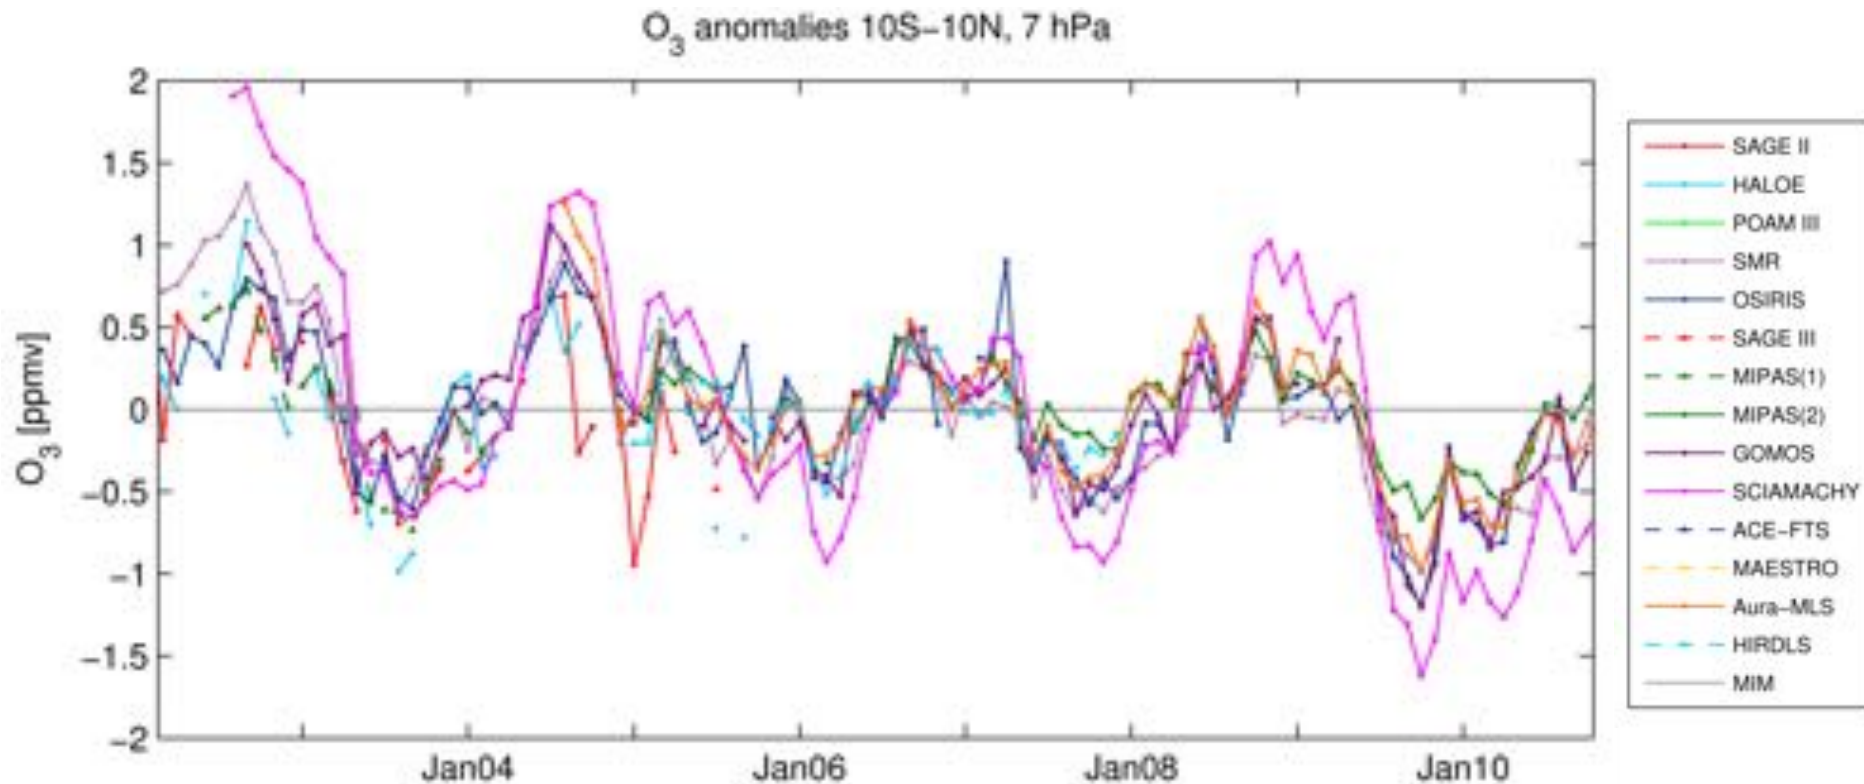

- Large differences in the annual mean comparisons but very good agreement of the interannual variability.

CH₄

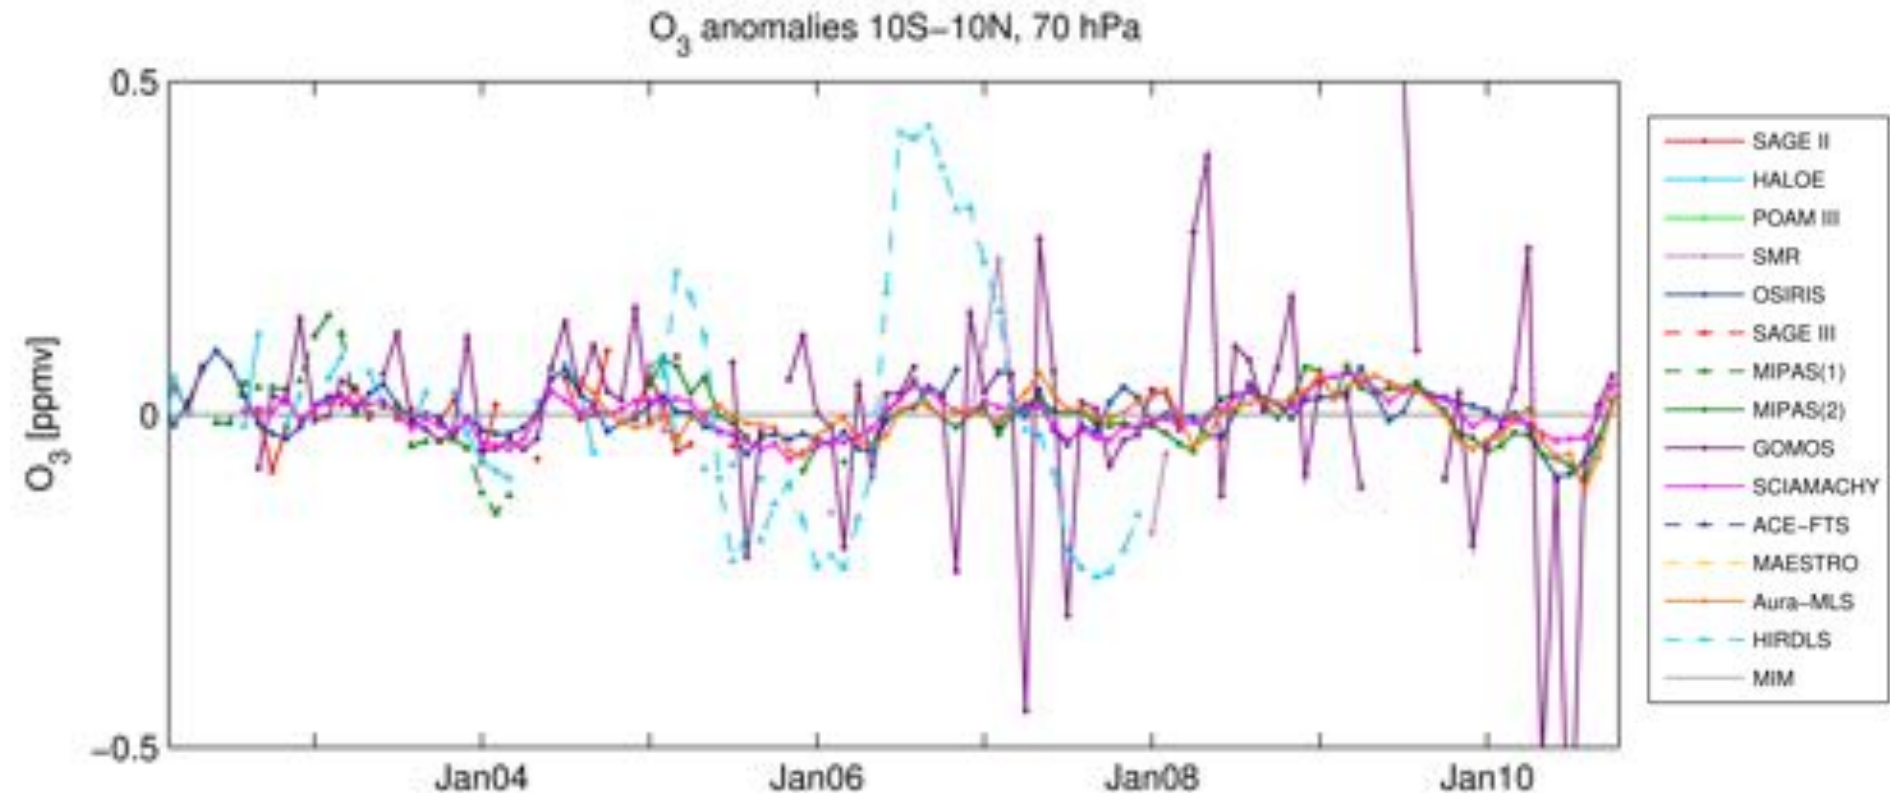

Ozone - Evaluation of interannual variability

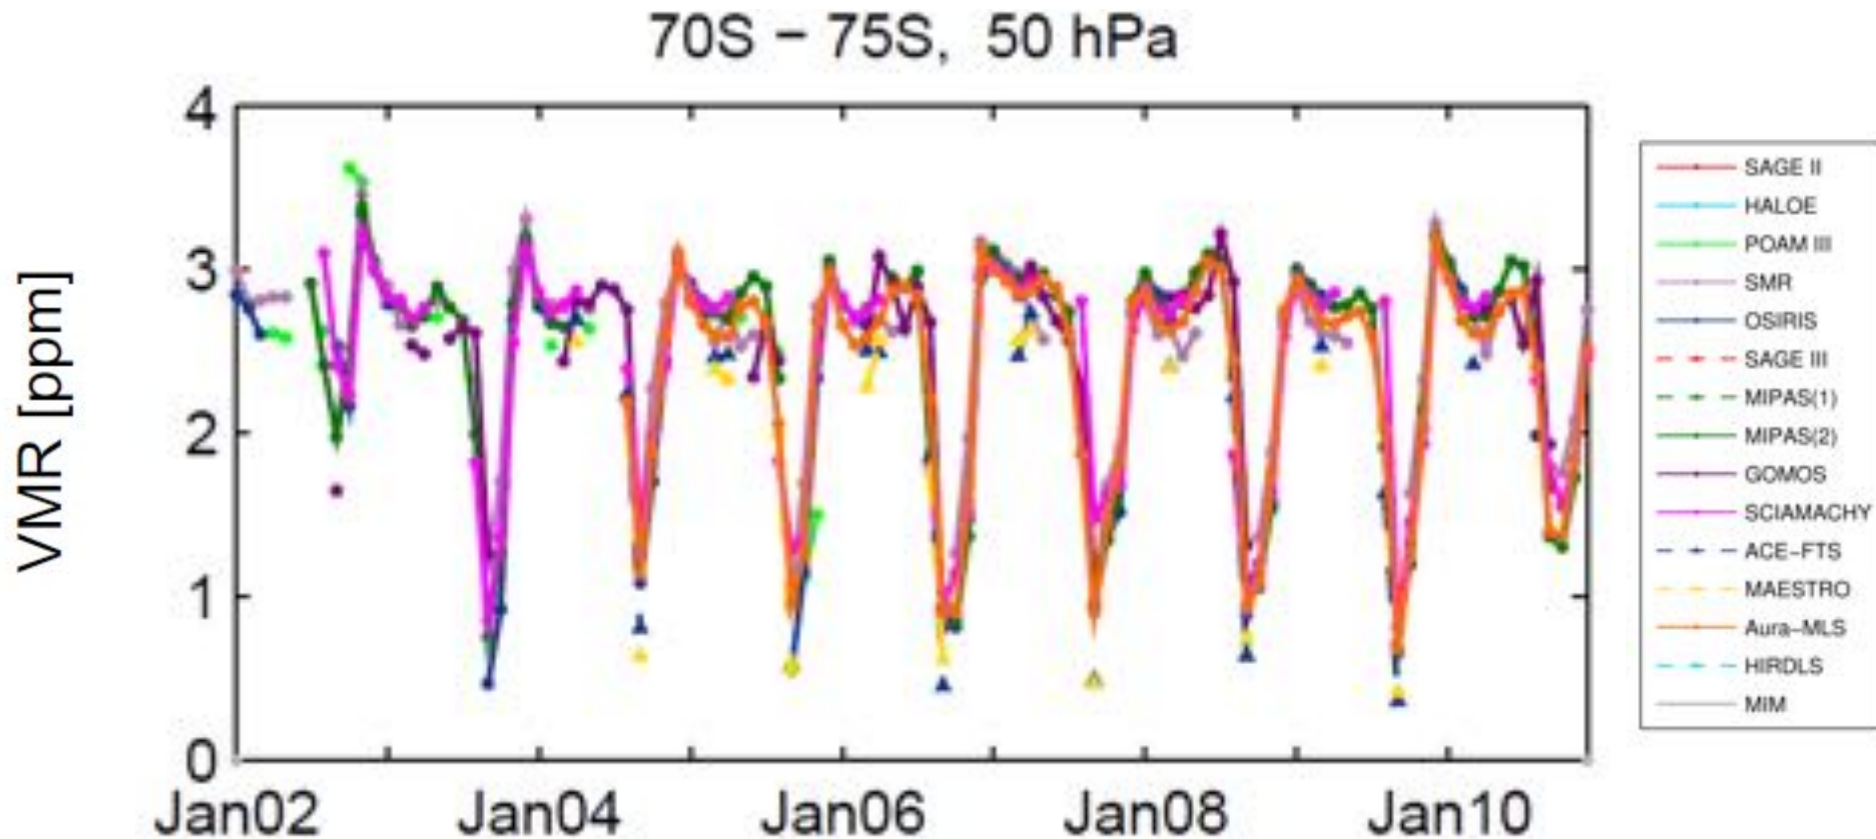

- Tropical **QBO** signal in the middle stratosphere is captured well by all instruments
- Slight deviations in displayed amplitude

Ozone - Evaluation of interannual variability

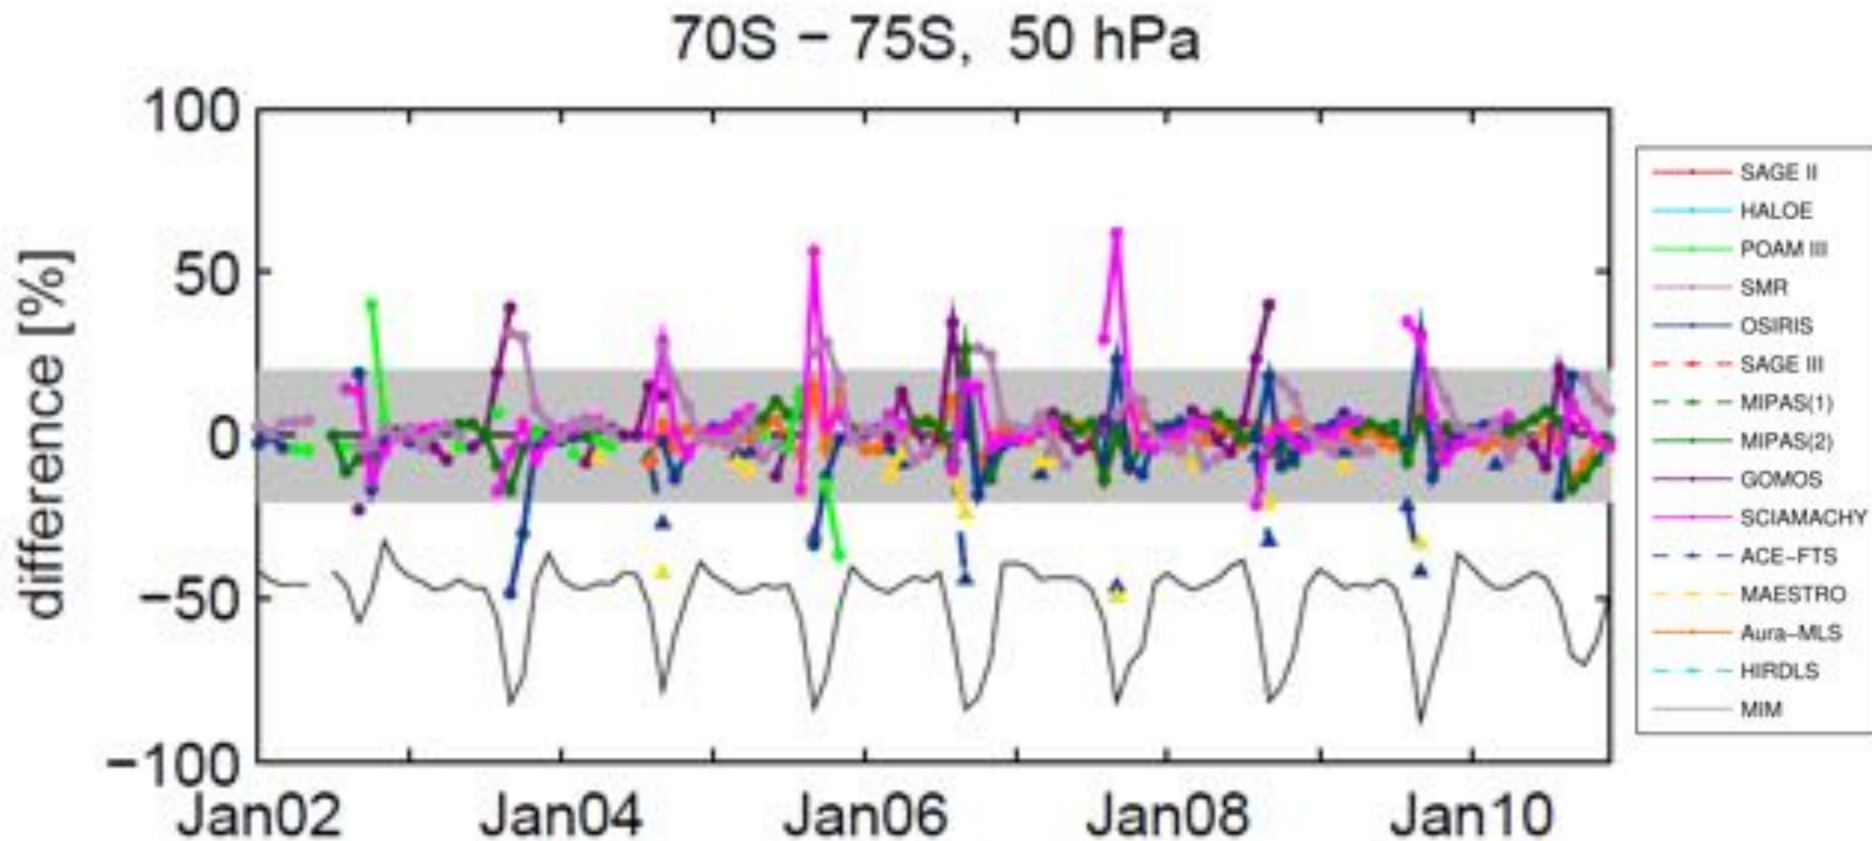

- **Larger difficulties in the lower stratosphere** where ozone abundances and inter-annual variations are small

Evaluation of Antarctic ozone

- Large relative differences (to the MIM) in the Antarctic polar cap region during the time of the ozone hole
- Spread between the monthly zonal mean fields of $\pm 50\%$

Evaluation of Antarctic ozone

- Large relative differences (to the MIM) in the Antarctic polar cap region during the time of the ozone hole
- Spread between the monthly zonal mean fields of $\pm 50\%$

Stratospheric satellite data for model evaluation

- Data Initiative: Provides the data and basic knowledge on data quality
- Mixed team of scientist
 - ✓ Generate list of diagnostics appropriate for model evaluations
 - ✓ Provide a 'best' estimate and its uncertainty range for ready use in model-measurement comparisons (CCMVal diagnostic tool)
- "Recipe" for deriving an observational uncertainty range
 - ✓ O₃ seasonal cycle at 200 hPa, mid-latitudes

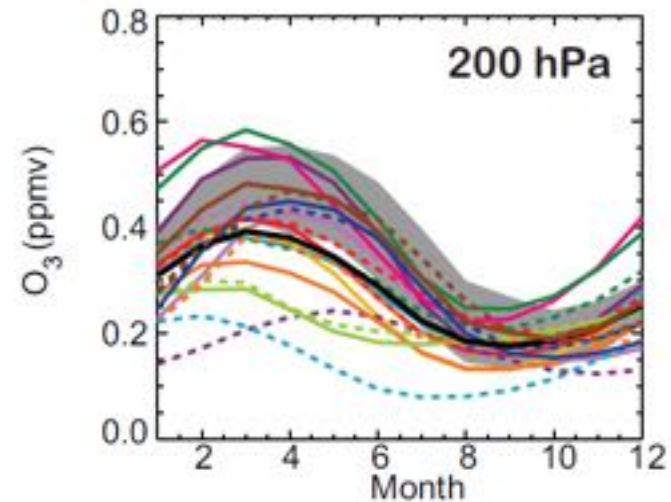

O₃ seasonal cycle, 40°N - 60°N, 200 hPa

Evaluate the representation of large-scale transport and mixing processes

CCMVal report, 2010

Observational data :

MIPAS 2004-2008

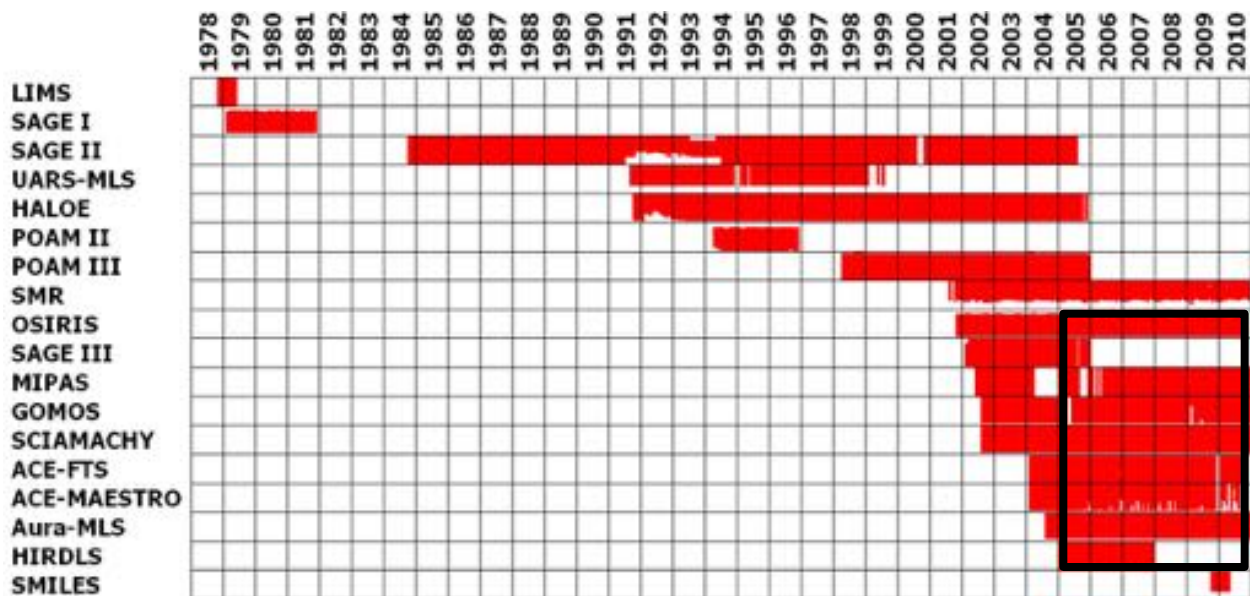

O₃ seasonal cycle, 40°N - 60°N, 200 hPa

Evaluate the representation of large-scale transport and mixing processes

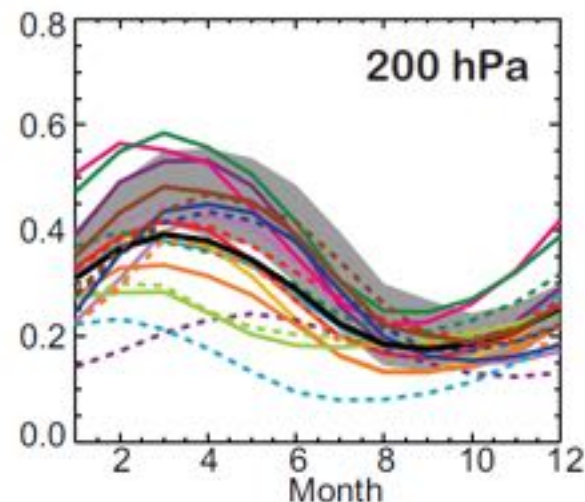

Step 1: Define time period

Find overlap period of maximum length including maximum number of instruments

CCMVal report, 2010

*Observational data :
MIPAS 2004-2008*

O₃ seasonal cycle, 40°N - 60°N, 200 hPa

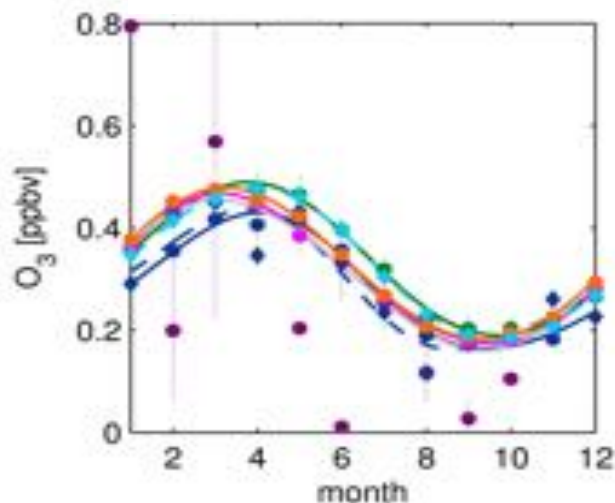

Evaluate the representation of large-scale transport and mixing processes

Step 1: Define time period

Find overlap period of maximum length including maximum number of instruments

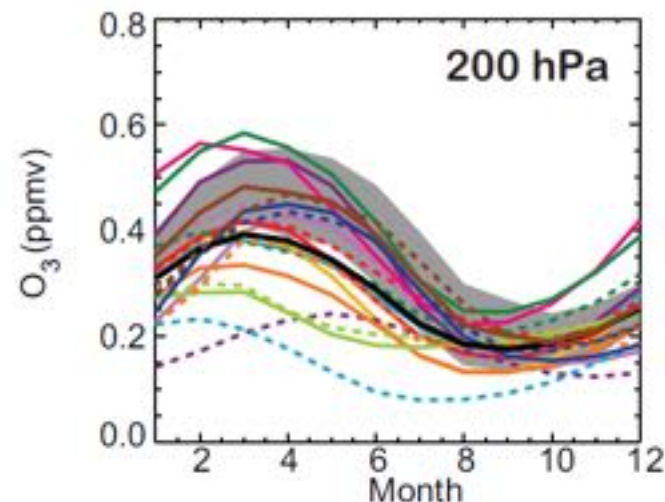

SPARC Data Initiative

 Observational data :
 MIPAS 2004-2008

Merging techniques

- Merging of two single datasets by accounting for an inter-instrument bias calculated over some overlap time period (SAGE/GOMOS)
- Merging of multiple datasets that uses detailed error characterization of instruments (Froidevaux GOZCARDS, Davis SWOOSH)
- Statistical methods to fill in observational gaps (BDPD)
- Nudged chemistry-climate model as transfer function between the instruments (Hegglin et al., 2014)

Problems

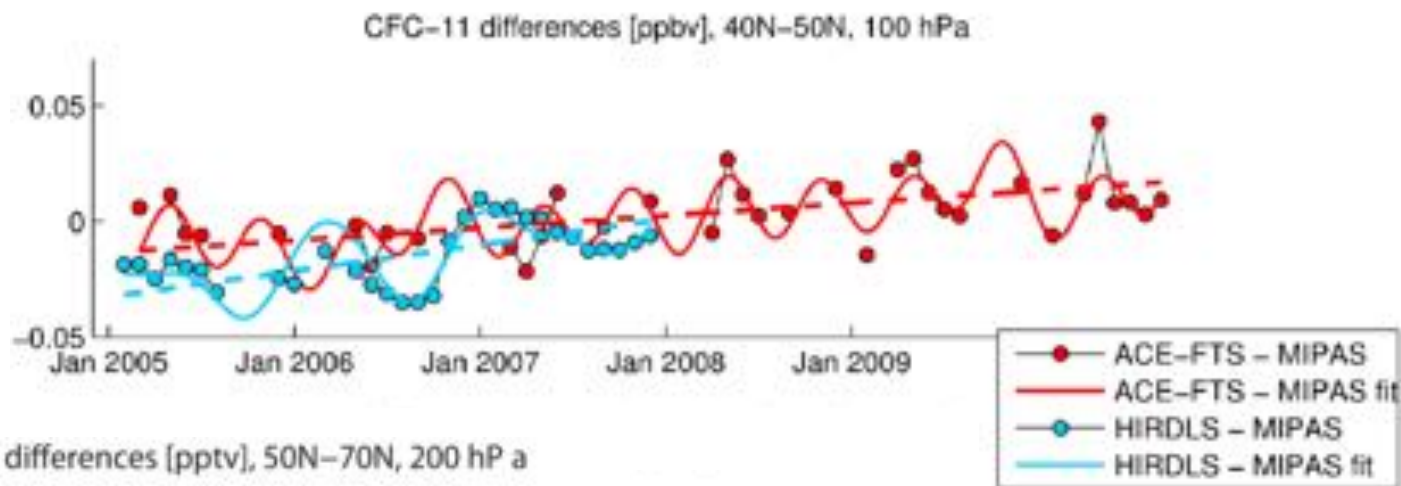

- Inverse estimated error (can differ between data sets, ideally instruments error covariances)
- Key problems: different altitude resolutions and different content of a priori information (application of the averaging kernel matrix)
- Drifts hard to identify (comparisons between two satellites non-conclusive, in situ measurements as reference often lead to lack of statistical significance)

Drifts identified by comparison to all other available data sets

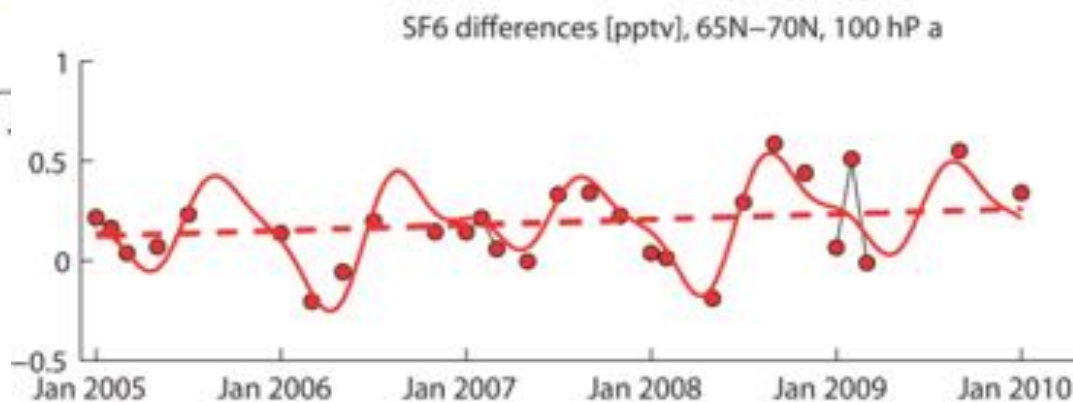

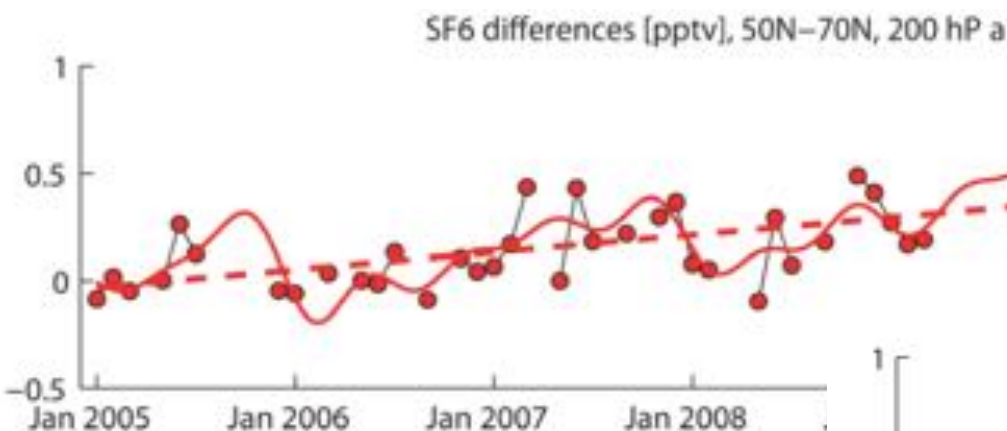

Multi-linear regression of time series of differences between pairs of instruments

CFC-11

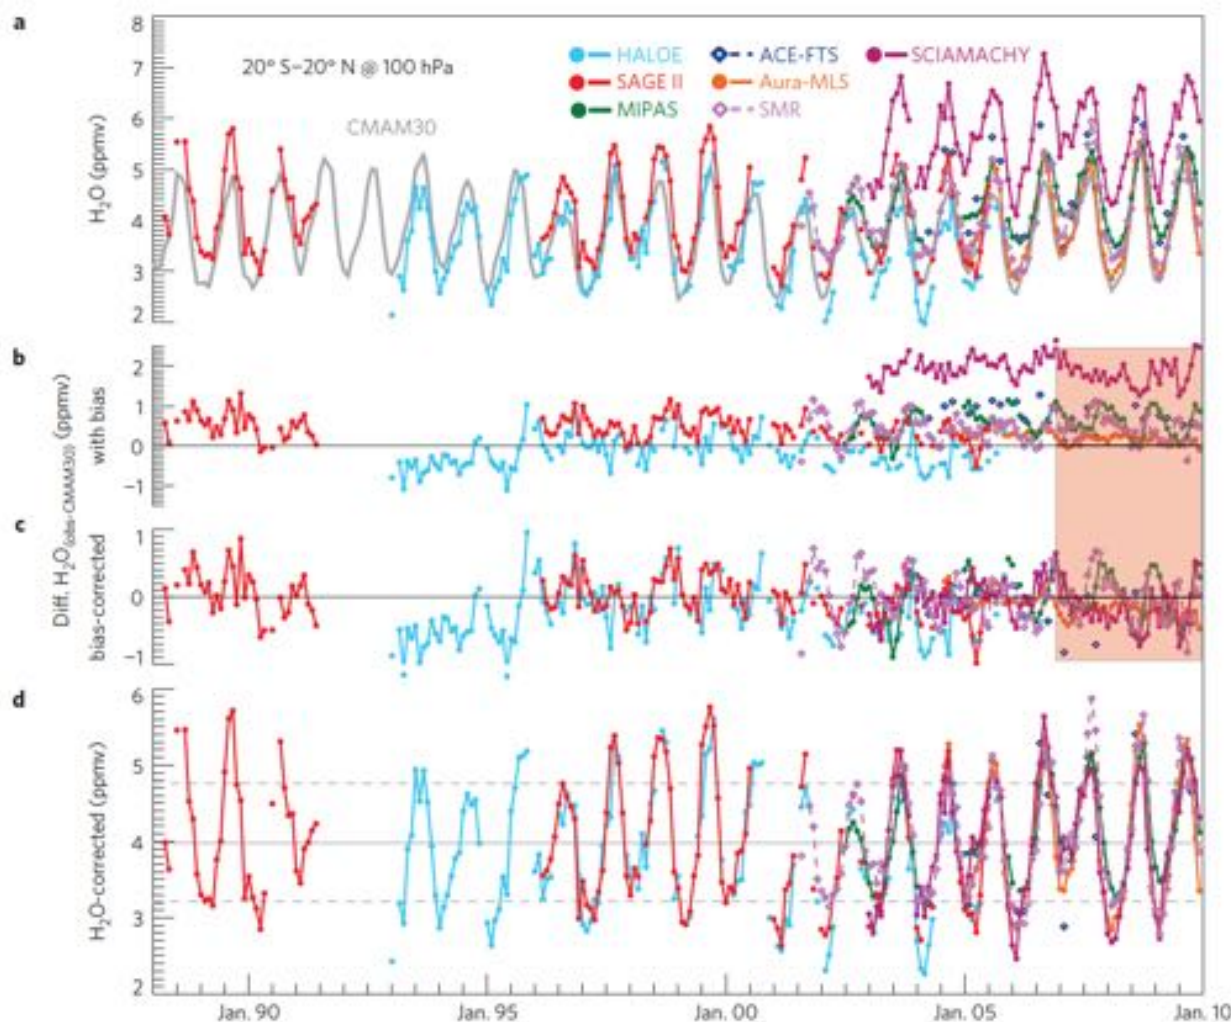

SF₆

CCM nudged to observed meteorology is used as transfer function between observational data sets

- Long-term data record
- Instrumental drifts
- Representativeness of spatially limited data sets.
- Lower/mid stratospheric water vapour trends are negative
- Upper stratospheric water vapour trends are positive, (accelerated BDC in the lower stratosphere)

Comprehensive comparison of satellite instrument observations

- Better knowledge of the quality of available data products including information on where they are consistent and where they exhibit unphysical features or strong deviations
- Assessment of the range of measurements as an estimate of the systematic uncertainty in the measured field
- Need for further evaluation activities (e.g., in the UTLS and at high latitudes) identified
- Motivation for improvement of data products

Provide monthly zonal mean time series in a common format

- Will be published on the SPARC data archive website
- Will be updated in the future as soon as new time series are available)

Improve future model-measurement comparison activities

- Depending on the evaluation and trace gas, individual instruments may need to be excluded from the comparison (e.g., seasonal cycle in LS)

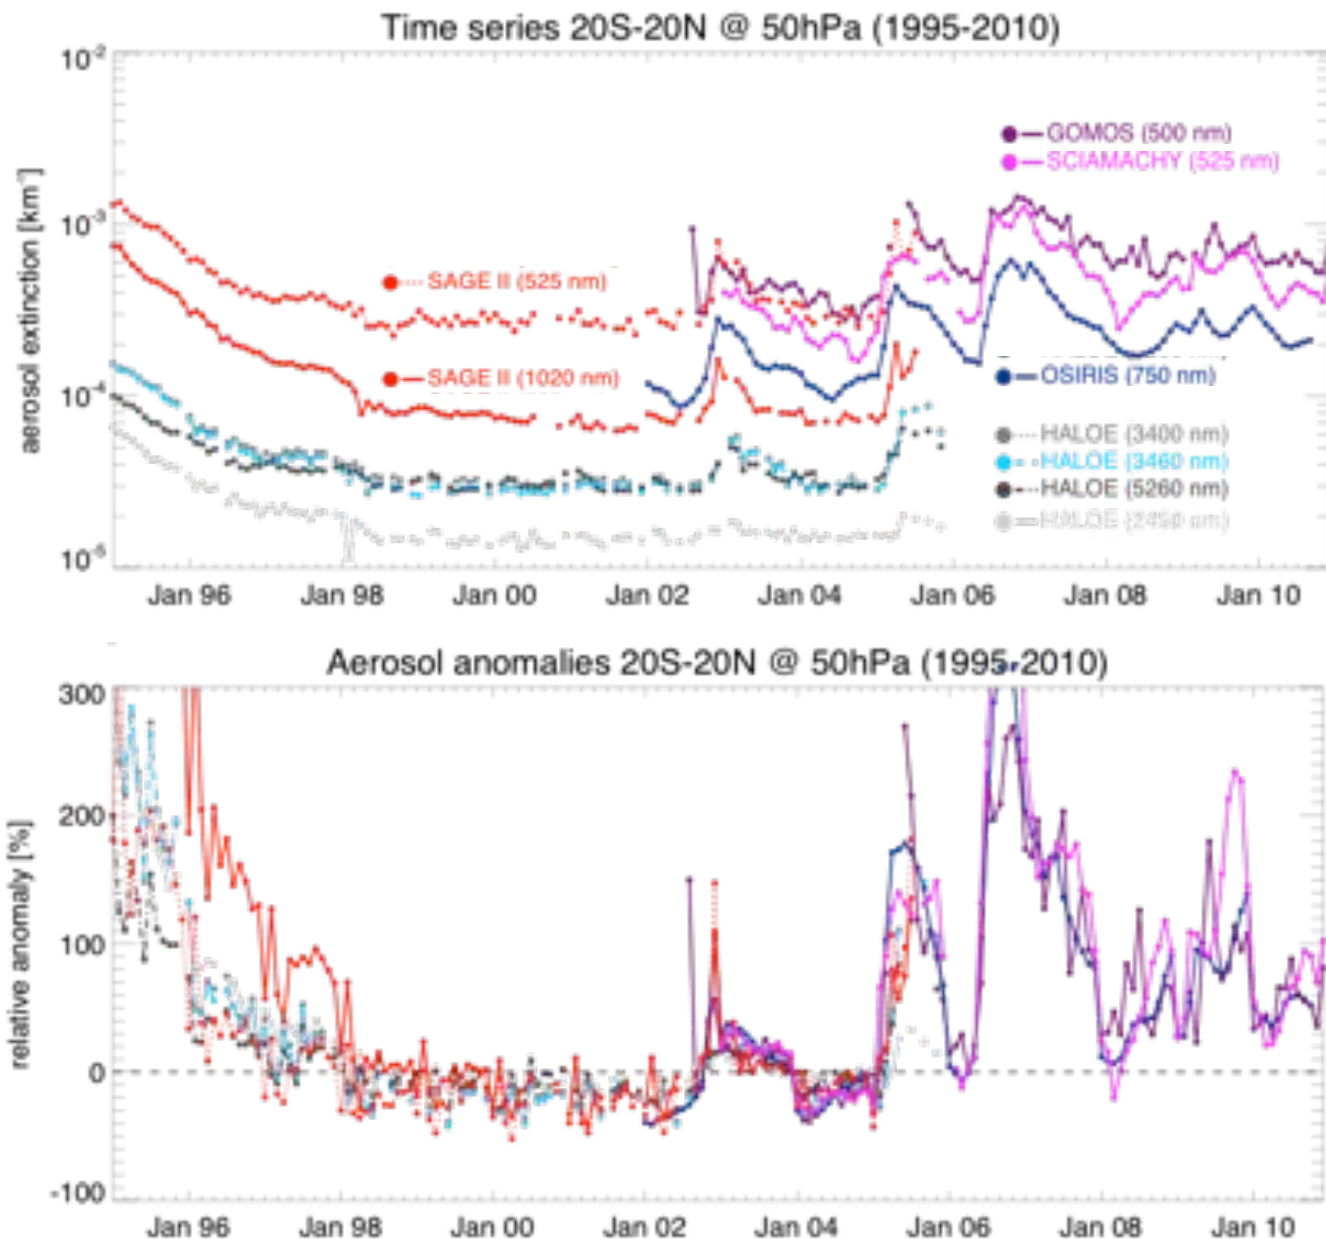

Aerosol anomaly evaluations

Aerosol time series between 1995 and 2010.

Aerosol anomalies are shown relative to 2003-2004 monthly means.

Relative anomalies compare well, with exception:

- SAGE II 1020 nm
- HALOE 5260 nm

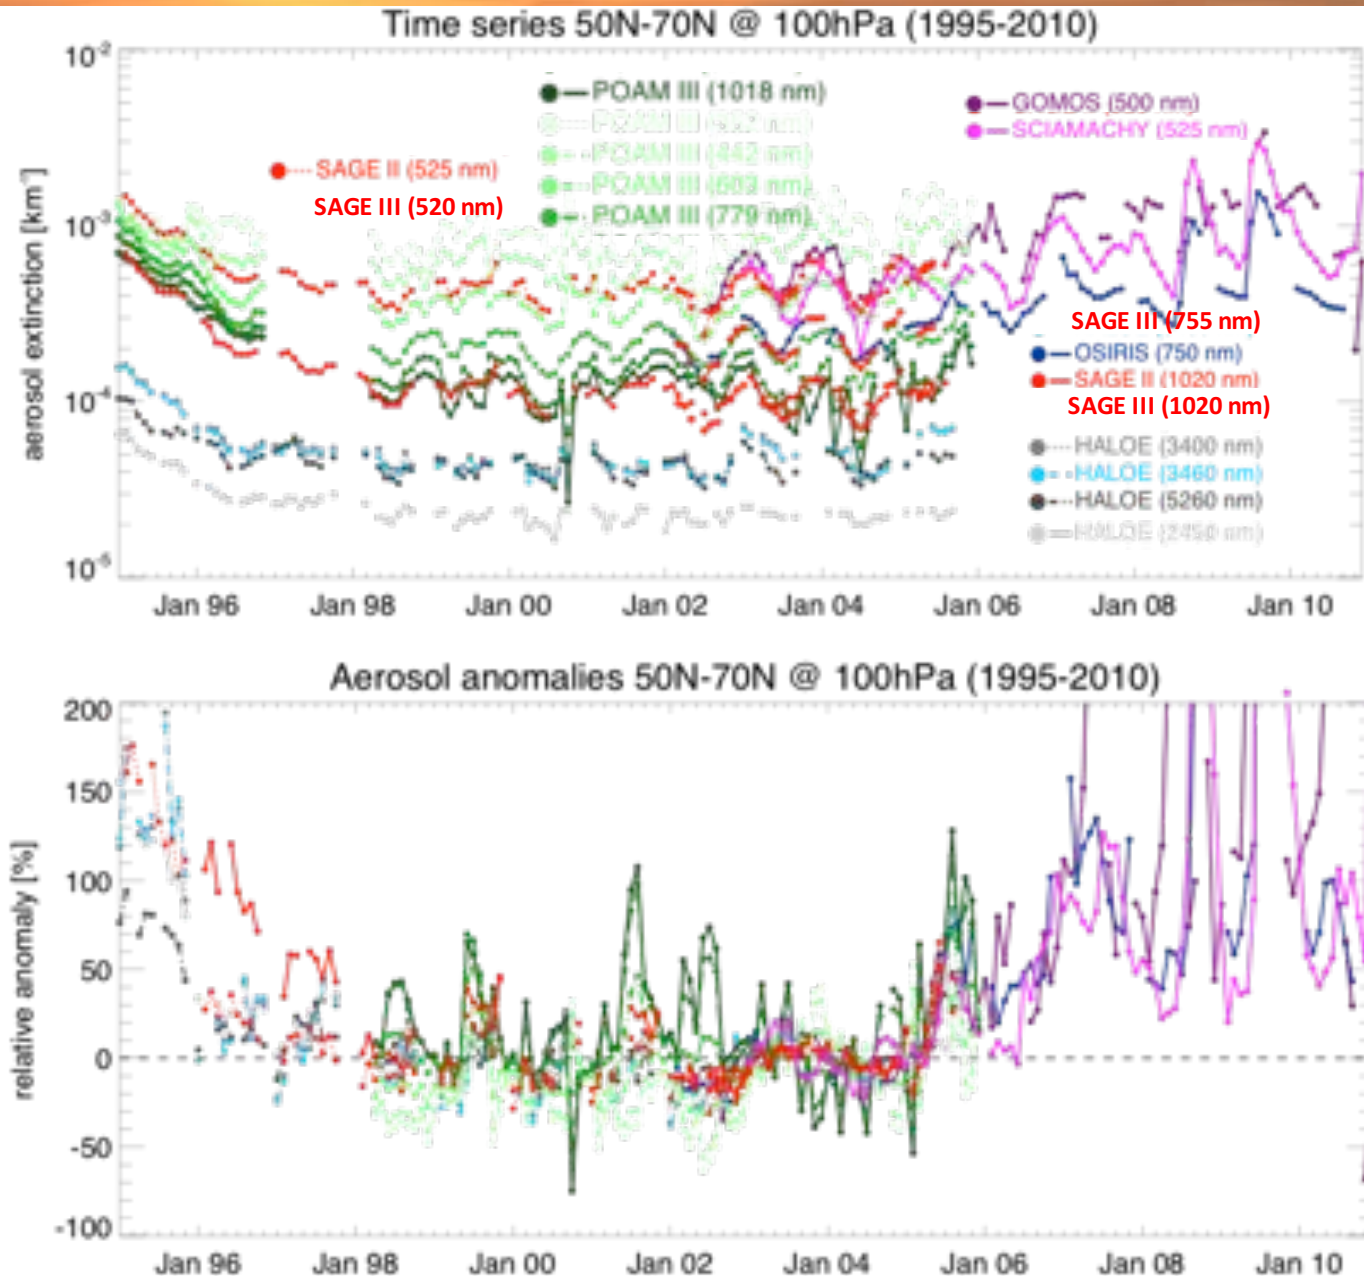

Aerosol anomaly evaluations

Aerosol time series between 1995 and 2010.

Aerosol anomalies are calculate using the 2003-2004 monthly means.

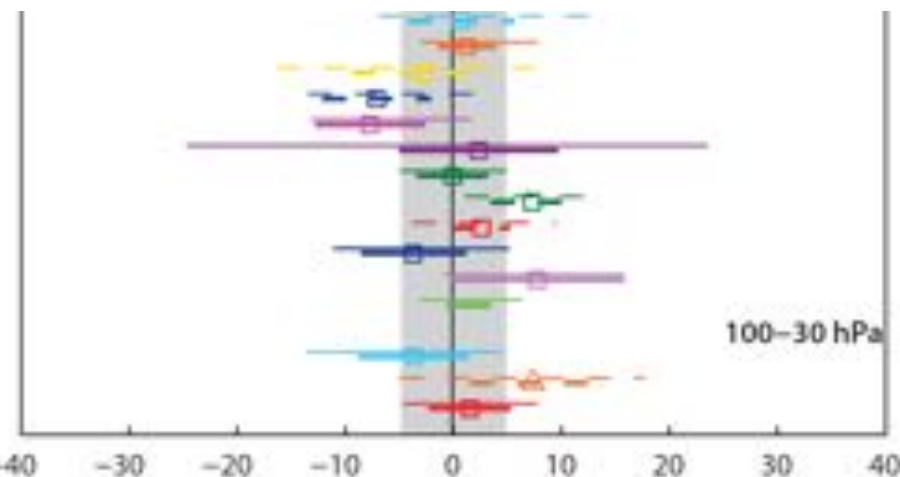

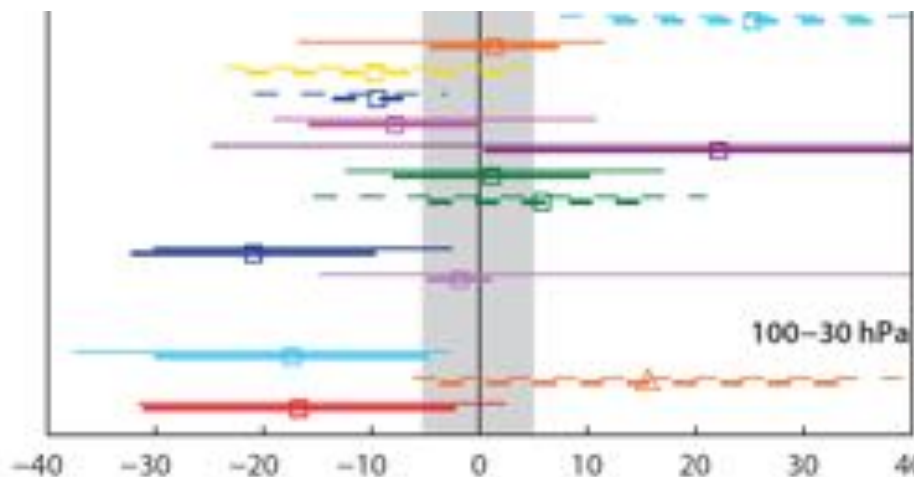

Extra-tropical lower stratosphere 'outliers':

- SAGE II 1020 nm
- POAM III 779 nm

Evaluation of 18 ozone profile data sets

Lower stratosphere (100-30 hPa) - Tropics: $\pm 20\%$ and Mid-latitudes: $\pm 10\%$

Upper troposphere (300-100 hPa) - Tropics: $\pm 20\%$ to $\pm 50\%$ and Mid-latitudes: mostly $\pm 10\%$
